Bill included rec.radio.amateur.misc in the list of newsgroups he posted the original message to. Since rram seems to be reserved for flames, discussion of amateur radio is evidently off-topic.

..

etc etc
==========
Oh ,I see, the Professor is selling (partly illegal)CB Power amplifiers.
Probably no solder smoke on his premises ......just carton boxes filled
with equipment ,ready for shipment to truckers' watering holes.

Bill , I enjoy listening to your podcasts ....keep up the good work.
Just ignore the above junk seller ,who apparently is NOT capable to
produce any civilised and intelligent response.

Frank GM0CSZ / KN6WH

Every on-topic post helps rram, even if only a little bit. Keep these
posts up. I added soldersmoke to my bashpodder list, and will be
listening to the podcast to see what it's all about. Number 32 sounds
very interesting so far.

The crap on news:sci.electronics.misc is crossposted from
news:sci.electronics.policy, which is a watering hole for the biggest
idiots on usenet.

4450. K5JHF Morse Code Device, 3.2/3.3

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-18 03:32:06 UTC
From: Tom Coates <tecoatesHatesSpam@comcast.net>
Message-ID: <buudnX0TCrMjjpPYnZ2dnUVZ_s6dnZ2d@comcast.com>
Source record: 10451

Does anyone have experience with this portable Morse training device, or others like it?

It's depicted here:
http://home.austin.rr.com/jfisher2/MCD.htm
K5JHF told me that no inventory remains and he does not plan to make any more. I am curious about how useful it proved to be for gaining and improving Morse proficiency.

Portability seems like an advantage, enabling the device to be used while driving, exercising, etc.

Tom, N3IJ

4451. Anyone got ancient ARRL books and equipment or junk boxes to donate?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-18 07:26:36 UTC
From: eternalsquire@comcast.net
Message-ID: <1158564396.521511.149980@e3g2000cwe.googlegroups.com>
Source record: 10452

All,

One of my neighbors in the principal of a middle school that is
interested in incorporating amateur radio as part of it's science club.
This is located near the Navajo reservation.
I'd like to train the members to be Tech+ and focus on the Novice CW
bands, because for these kids brass pounding across the country is
where the 'wow' factor is.

Anyone interested in donating books, equipment, or junk boxes? It
would be tax deductable.

Thanks in advance,

The Eternal Squire

4452. Connectors for MFJ-269

Hello all of you,
I am using my MFJ-269 now more frequently.
The more I use it the more I have questions.
What kind of connection do you use when you want to measure inductor
or capacitor or to check the impedance of a resistor ?
I have use the cable of my scope and a homebrew pl259 with wire and
aligator grip with various result.

Happy day

Hi Jean, I use a PL259 and a couple of short pig tails (6cm) with an minature alligator clip.

If you are measuring L or C, their Reactance is frequency dependent. The frequency at which you measure must be such that Xl or Xc is less than 650 ohms. (the MFJ takes the reactance and the frequency and converts that to L or C). Sometimes the frequency will be high enough that the stray L or C of the pig tails will affect your reading. Up above 20-25 Mhz I measure the L and C without the component hooked up and subtract that reading from the one I get with the component connected. Hopefully that takes some of the error introduced by the long leads out.

You can check out my free program:
http://www.xertech.net/Projects/CPwin.html

or scroll down the page to a set of zipped pre-recorded mp3 files.

I wrote it so I could record sessions and practice with a cheap personal
audio player. Key feature is audio voice prompt of what was sent in cw.
I think the idea works, but I need to keep at it myself. I never seem to
keep at it long enough to improve.

++++++++++++++++++++++++++++++++++++
Rex , Thanks for making this prog. freely available , it works very
well. Congrats.
The large character display & voice feedback is excellent for visually
impaired users.

I have passed the prog on to other hams.

And, it appears not to comply with several specific FCC regulations:

- It has gain through the CB frequencies (violates 97.317 (b)) and is thus not eligible for certification, which is required for amps operating below 144 MHz. The FCC may be about to relax or eliminate the 97.317 rules about external amps operating in this frequency range, but for the moment this reg is still part of the law.

- Its second- and third-harmonic distortion levels are roughly 10 dB too high to meet the -43 dBc requirement (violates 97.307 (d)).

Source record: 10461

Hi..
In the past, I've always mounted my coils vertically but
this time around, I need to mount some horizontally. I was
simply going to glue them to the pcb but wanted first to get
input as to other home brewer's method of mounting toroids to
a pcb. The toroids will be FT-37-43 type wide band transformers
in the 10MHz range. Your input is welcome. Take care.

Hi Jim, I guess the first thing I would consider is differences with the leads getting to pads. Horizontal is more stable than vertical, but takes up more space. I guess the big factor would be the space requirement. I would never mount one vertical if there were space for horizontal. That determination would be dependent on the layout of your circuit board. Good luck.

Yeah. A touch of silicon adhesive or hot melt seems obvious. Can't think
what more is needed unless you find something that seems to not be
working as expected.

4467. ARC-5 Tuning Shaft Adapters

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-19 04:03:02 UTC
From: "LenAnderson@ieee.org" <LenAnderson@ieee.org>

Source record: 10468

Does anyone have or can they direct me to a couple of "splined"
tuning shaft adapters that fit the ARC-5 Command Set receivers?
I'd like to adapt some of the ganged variable capacitors from
those sets into some homebuilt equipment...lovely antibacklash
gear reduction on them.

Been trying to search the 'web (at the usual suspects such as
Fair Radio, Toronto Sales, etc.) but no joy. Yes, I know that
some consumer radio plastic knobs will fit, but those also
break very easy making the MTBFs very low indeed.

I would suppose that there is a mechanical description for the
splines and diameters but, alas, I ain't one of those. I've a feeling
that several mechanical hardware suppliers have them in stock.

Will appreciate any info, will trade assorted items for a couple of
metal adapters to metal shafts.

Place a thick plastic washer between the toroid and the board to reduce
stray magnetic and capacitive coupling between coil and metallic surface.
Toroid coils are not completely devoid of coupling to nearby external
objects and surfaces.

I've always mounted smaller toroids (<1" OD with copper) vertically. For larger ones, either a pair of cable ties of some neutral cure silicone adhesive works for me.

Hmm... that doesn't really seem that much easier than just using a glue gun in the first place, is it?

Personally I'd also worry about detuning due to having the coil sitting right on top of the ground plane like that, but I suppose that if he's manually aligning everything anyway it doesn't really matter.

4474. Re: RFSim99 anomalies

Tom,
One other odditiy I found after replying was that with the 10dB basic pad loaded in in RFSim99, giving the bogus S parameter, by clicking on the up or down arrow for tolerance in the simulation mode, it would give what appeared to be reasonable results. However, clicking on the button to return it to normal gave the bogus value again. I guess I was optimistically thinking that after the tolerance iterations, it would see the error of its ways and give a realist value. Obviously, the software is not "self-healing", ala the topic of the recent IEEE Spectrum article.

What you say about extreme sensitivity is on the mark. I later experimented with GPLA and saw the same effect. I hadn't thought of it in the balanced bridge context.

The main reason I haven't homebrewed one of Rick Campbell's IQ designs is the need for those tight parameters, which translates to relatively high cost in the parts required... :(Some of the inductors for one of them, the IQ DC receiver, I think, are no longer available when I checked Mouser and Digi-Key. I suppose AADE still has the stock, but building from scratch is obviously cheaper if you can get a direct source.

One femtoFarad? Wow! I'll have to play around with this some more, and your idea of paralleling (or series-ing, I guess, as well), sounds interesting. It could be an indicator that the results are valid, I should hope.

I really like RFSim99 as a first-cut design tool. Very simple and straightforward. It's very nice for L-networks. As with the AADE filter designer, I typically then run any design through at least one other tool for confirmation. I've had some problems on occasion with crystal filter design for certain configurations using XLAD, so I've done the design using another tool, such as the AADE design tool, and then entered the values in LadBuild, and continued to tweak in GPLA.

We're very fortunate to have such programs at our disposal.

Mike,
Tell us how you *really* feel! ;-) .

I didn't see any BNC bulkhead connectors, which is what I typically use for price comparisons, since I seem to use so many of them. I haven't ordered from this vendor, but I'm tired of having the insulator melt on some of the ones I've bought for about a buck.

Direct conversion is used in nearly all modern mobile phones, because it is cheaper (no IF filters), and because the baseband amplifiers use less current than the old IF amplifiers used to. The RF performance is not necessarily as good as a well designed superhet.

It is difficult to make the receiver immune to "AM detection" which is a problem caused by receiving a strong interfering signal with amplitude modulation on it, at a frequency other than the one that you are trying to receive, but which somehow gets turned into a baseband frequency signal coming out of the mixer, even though it shouldn't. There are plenty of reasons why this can happen, such as second-order nonlinearity in the mixer, meaning that a strong interferer coming into the RF port of the receiver can mix with itself in your mixer and end up on top of the wanted signal. Another cause could be if there is coupling between the LO generation circuit and the RF input (in either direction, both are bad.) Also it is common to get large DC offsets coming out of direct conversion receivers, and for some modulation formats where you're interested in frequencies down to DC, that can be a pain. People have pretty much solved these problems in phones, after a lot of work.

Guys..
Does anyone have any better method for stripping small, enameled
wire, other than using sandpaper or an exacto knife (scrapping)?
There used to be a chemical stripper called 'Xvar', years ago.
This stuff worked great. Nasty stuff as you can imagine and has
been EPA'd years ago. Is there anything comparable, today?

Also, a retired technician that I once knew had a pair of ingenious
'stripper pliers' that he had acquired back in the '60s that did
a fabulous job. These pliers had special jaws that would scrape the
enamel off without nicking the wire. They worked GREAT. Supposedly,
this tool originated from a mfg in Germany. I have never seen this tool
since. Anyone have a lead on something similar?

Thanks and take care.

I've heard about that tool, also. My only experience with enameled wire
is melting/burning it off, then sanding off the little remaining crud.

I know, probably "Been there, Done that".

For a long time, I've used heat-strippable wire which I got surplus. It can be stripped just by heating at 750-800 degrees for a minute or so with a soldering iron. The trade name, I believe, is "Solder-eze", but a web search doesn't reveal a ready source. (I did find a number of people asking where it could be found, but no responses.) Hopefully a reader knows of a source and can tell us. A nice summary of various ways to strip heat-strippable wire is at http://www.ac6rm.net/mailarchive/html/elecraft-list/2005-10/msg00598.html.

While searching for information on heat-strippable wire, I came across the suggestion for stripping conventional enameled wire with paint stripper. Apparently it takes a few minutes, but does work. It's nasty stuff to work with, though.

Thanks, Andrew...I got that impression after several hours of web surfing. :-) :-(

My 1948-acquired Command Set surplus stock has slowly withered away ($6 for receivers, $12 for transmitters, $18 for antenna tuning unit-modulator-Tx dynamotor at that time). I'd gotten 4 of the tuning "knob" adapters back then, 2 got traded-sold, 1 remains on a 6-9 MHz receiver, and 1 is lost somewhere unknown.

Beautiful anti-backlash worm drive on those ganged capacitors. Would be good for tuning anything.

Not being a machinist I was hoping someone would come up with the correct words to describe the splined whatsis so that I could haunt a few mechanical parts suppliers for something that would mate smoothly with it. I tried some copper tubing (pressed over splines) with marginal success (several diameters, easy to get at do-it-yourself stores for various small water piping uses) but those bend rather easily. [it's not too swift when one's home machine shop consists of a Big Lots table top drill press...:-)]

I did come across a Magnificent website with Great pictures of WW2 radio equipment in US military aviation: http://aafradio.org Now there is a Collector! [and a consultant at the Smithsonian Air and Space Museum]

I mentioned a commercial paint-stripper in here, have tried another
brand. Wayyyy slow. Having used commercial paint strippers in
days before EPA had declared nearly everything "toxic, harmful to
health" those paint stripper compounds were a lot stronger. It
works, sort of, but one can use up a half roll of paper towels to
make a dozen-plus toroid inductors' end-stripping. [okay, some
exaggeration there] It is messy and usually takes a second
application of goo to clean it off good enough for soldering.

GONE is good old General Cement "Strip-X" (company says it
has no plans for anything similar in future) and the "Solder-Eze"
is relegated to "old stock." Since "magnet wire" is still used
in industry, hobbyists need a hint or three from those working
in that area now.

With FT-37-43 toroidal cores, the outer diameter of the form
is 3/8 inch, right?

There should be very little change in inductance by simply
gluing that small an inductor to a non-conductive spacer
at least 1/8 inch thick...such as most any plastic material.
I've used two-part epoxy from the hardware store, a silicone
RTV goopy stuff (from same store), even my wife's glue
gun for craft work (lots of TLC involved in such persuasion),
all worked well. I'd judge that the two-part epoxy would be
the most long-lasting on fiberglass-epoxy substrate boards.

It would be fairly difficult to do it on it's own. Using a pocket PC or
some similar device, you could do it easily. The problem is finding a
device that could do it that would not cost more than the HT.

Basicly what you need is some sort of system that accepts connections
from bluetooth devices and plays the digital sound to a digital to
analog converter. Since a pocket PC has the bluetooth and a "sound card",
it would be simple under Linux. It might be simple under WINCE, but
I only know about building handheld Linux devices.

Depending on your location you _might_ still be able to buy a quantity of MEK (methyl ethyl ketone) at a paint or hardware store. This is a strong and effective stripper for many insulations, and may very well have been the primary ingredient in the Xvar stripper you mention. As you say, it's bog-nasty stuff, and should be used with serious caution.

Some people just flame the end of the wire briefly - long enough to scorch the insulation but not long enough to oxidize the wire. It makes scraping off the insulation much easier... but takes practice.

Not marketed as such, but there *are* Bluetooth adapters out there for devices
that use "standard" headphones and microphones, such as cell phones (e.g.,
http://www.amazon.com/Jabra-A210-Bluetooth-Adapter-2-5-Universal-Headset-Jack/dp/B0006HES2
I/sr=8-1/qid=1158779198).
Adapting that to an HT is, I expect, no more than perhaps a bit of level
matching an connectorization.

Another variety of this is Belden "Beldsol", which seems to be widely
available... Mouser, Newark, RS Electronics list it.

And, an eBay search on "solderable magnet wire" will probably turn up
some supplies of this sort of wire.

I've purchased some from RoadRunner in the past:
http://www.rrunner.co.uk/wire/qse.htm ... probably not particularly
cost-effective, being overseas, but if you only need small quantities it's OK.
Another UK company, Vero, has it as well:
http://www.verotl.com/products/index.cfm?content_id=7846BCBE-F067-441A-9F53A51D8E4CC6B3 -
- never dealth with them personally.

==========
Not knowing the equipment being discussed ,I could suggest the following general method of extending a 6 -6.35 mm shaft . (6.35mm equals 1/4 inch)

Take 2 (if possible identical) non metallic knobs for the shaft diameter concerned ,for example the push-on potmeter knobs found on almost any VDU or older TV and BC radio sets , used to push onto splined potmeters . Equipment from Asian origin is always metric ,hence shafts dias are 6 mm . Fit the 2 knobs concentrically piggy back ,with either epoxy or 2 or 3 bolts /nuts either metallic or non-metallic (say nylon).

Push/fix 1 knob onto the splined shaft to be extended.
Fit tubular/solid extension shaft into other side.

If alignment with front panel opening is a problem , glue flexible material (for example rubber ,dense foam or expanded polystyrene)in between the 2 knobs . Of course all this provided there is enough space in the enclosure.

This method is also very suitable for applications involving components with a rotary shaft which should be kept free from ground ,like in antenna matching units (tuners) .

If the to be driven shaft has a 1/4 inch diameter the mating knob must suit this ,but the other knob can be for a 6mm dia shaft and final front panel knob There is a lot of flexibility.

Len, today is your lucky day. I have ONE splined whatsis, the tuning knob that was included in every maintenance kit for the BCxxx series. Steel with a heavily knurled 1/2 inch knob.

Send me your snail mail address, pretty sure I'm not going to be using it.

Years ago, working with "Litz wire", I used Red Spirit and a small burner or a small blow torch. We dipped the wire in the spirit and then burned it.

I'm not entirely sure if the Litz wires we used had secondary lacquer isolation but I think so and that was the major pain with that wire.

A quick heating up and a swipe with a cloth should do it. Red Spirit was originally almost clean Ethanol (While doing my military service in the Signal Corps ages ago, we used to nick it and mix it with coke or tonic water on Friday evenings...)

You can buy a cheap BT adapter for a couple of Dollars. You also need to add a simple VOX to be really happy. However!!! I do recommend you getting one of these throat/vibration mic headsets with a thing plastic tupe as earpiece. Replace the original BT mic+earpiece and you have a solution that actually works.
BT headsets are notoriously bad as they pick up to much noise. A throat mic is just so much better. Also, these throatmic headsrets comes with a neat ptt on a vcable. Vox just doesmn't work properly on a bike unless you have it low sensitivity and really shout at it for tx...

Cheers

Solder strippable wire is also called "Bicelflux wire" and it's a polyurethane enamelled heat removeable insulation. Long ago, I bought several small putups from a no longer remembered US supplier, however, among others, it's available from:

http://www.greenweld.co.uk/acatalog/Shop_Enamelled_49.html

in a variety of wire sizes.

When the insulation is removed with a dollop of molten solder, a toxic gas is released (in small quantities to be sure) and it ought to be done with good ventilation in the workplace.

Hi,

I am reading the ARRL Handbook on Receiver Design and frankly, I find it's a bit out of my league. The writing assumes some knowledge of circuitry that I am weak on. Eg., I think I can I can see from the schematic that an RC circuit is shifting phase in a quadrature amplifier stage but it's not mentioned in the text as such.

Hopefully, someone out there can get a sense of where I am on the learning curve and can suggest an appropriate text (not TOO basic, I guess).

Thanks!

hello all,

i need the rf board from a ten tec 509 rig. i had one follow me home but the rf board is missing. i called ten tec and they have all the parts for the board, they just no longer have the board. i am planning to build the final on perf board if i can not find one from a parts rig. the board or rig does not need to be working. i'll fix the board, just wanted to save a little time. any help appreciatred. 73 mike ku4yp

Good tip, Frank! Thanks but I've tried that before. Depends on the
polymer of the knobs...some can take moderate flexure (usually
polypropylene?) but others (polystyrene) can't.

Thank you Dan (you spell the surname correctly!). :-)

"Red Spirit?" Unfamiliar term to me on this side of the pond.

I've tried Toluene and MEK and found them lacking. Turns out
that (in varying percentages) are part of the paint stripper goop
sold in do-it-yourself stores over here. I can get Ethanol and
may try that.

In years past, the General Cement Company of Rockford, Illinois,
had a blackish goop they marketed for stripping magnet wire.
Worked extremely well, dip once, let it sit for a minute and the
enamel coating can be seen to actually lift off of the wire. One
wipe and the wire surface is free, ready to solder. Had a
definite acid content from the smell of it (sharp, acrid). The
tradename was either "Strip-X" or "Strip-Var," not sure which
now. :-(Mine was used up years ago, bottle tossed out.

GC Electronics "Strip-X", I assume? I found a MSDS which states that
it's 70% methylene chloride, 25% cresol (isomers of cresylic acid),
around 5% ammonia, plus some wax and thickening agents.

One poster stated that it was designed to work with Formvar
insulation, and might not work as well on the newer Polythermaleze
insulation.

I don't see it in their current catalog... probably gone where the
goblins go, yo ho!

I had occasion recently to wind a couple coils. Checked my stash and
found two different kinds of 30 ga enameled wire. I thought I'd try
tinning the ends of the wires without stripping. One of the wires
soldered very easily in a few seconds so must have been
heat/self-stripping. The second sample didn't solder as easily, but I
kept the wire in ball of molten solder for 10's of seconds and
eventually the enamel melted off and formed sludge on the surface of the
solder ball. Cleaned the corrupted solder off the iron tip and the wire
tinned up ok.

Not sure if the second one was normal enamel or just a slower version of
self-strippable wire. Might be worth trying to just melt the enamel off
in a ball of solder like I did.

There are two totally different families of enameled wire, and the
original question didn't say which one.

For the pretty-coloured polyurethane enamels, solder stripping is the
way to go. As Harold says, that is how they are designed to be stripped.
Professionals use a solder pot, while the rest of us make do with a big
bead of molten solder on the tip of the iron. Don't use a flame for
solder-strippable wire - it's too hot, and charred polyurethane enamel
sticks to the wire.

Heated for long enough at the right temperature, the enamel comes right
off with no scraping required. The decomposing enamel also acts as a
solder flux, so the stripped end is bright and ready-tinned.

The other type of enamel is usually brown - some of it is your
grandfather's brown lacquer, but the modern stuff is not.

The really old stuff can be charred in a spirit burner (chosen for its
cool flame which doesn't oxidize the copper) and the loose carbon
scrapes off easily. Note: this is the *only* kind of enamel that is
suitable for flame stripping.

The modern brown enamels are totally different. They are mainly intended
for motor and transformer windings, are often double-coated, and are
specifically designed to be heat-resistant and tough as old boots. They
are almost as tough as the copper underneath... and there's your problem
in stripping it.

This stuff laughs at molten solder and spirit burners. Heat stripping is
no good because flame temperatures high enough to decompose the enamel
will also oxidize the copper underneath. As far as I know, the only ways
to remove it are by scraping, sandpapering or filing... all of which are

difficult to do without nicking the copper wire.

So how do the professional winding shops do it?

GM Ian, guess you're getting used to the Highlands by now. Had a great trip to Scotland for 3 weeks in June, Blair Athol to Glencoe. Not long enough though. Yes, Polythermaleze and heavy polythermaleze and Formvar are the chrome vanadium steel of insulations. If you want to wind wire tightly around a faceted diamond without damaging the insulation, those are what you use. Basically, One divided by Bicelflux.

Professional winding shops invest in a machine that looks and operates somewhat like an electric pencil sharpener. It abrades the insulation and is automatically set for each different wire size. Needless to say, they come a bit dear. (Not as dear as diesel fuel in Pitlochry, but dear!)

I suggest "Experimental methods in RF Design" if that is not the one
you are using... If it is the one, you need to start by building a few
of the basic blocks, RF amp, Mixer, IF amp, AGC, etc. one at a time and
then combining them...

Depends a lot on the type of "enamel" that you are dealing with. As noted elsewhere, some is fairly simple to do with hot solder and some is resistant to thermonuclear techniques.

I've been successful with one of two methods on most of the stuff.

As noted, a solder pot (fairly cheap, by electronics tool standards) will do the job nicely on 90% of enamel wire.

Or, a professional paint store (NOT HandyAndy) has a parTICularly nasty chemical paint stripper called "Aircraft Paint Stripper", mostly methylene chloride which is highly toxic. About five minutes soak in that would strip the chrome from a trailer hitch. Don't sit in a spill of the stuff or you'll be talking in a high squeaky voice for the rest of your life.

I dunno if anyone here is good enough to know, but it's worth giving a shot... I stumbled on a website (http://mikroelektronika.co.yu/english/product/books/rrbook/chapter4/chapter4a.htm)on how radios work, and how they can be made with various IC parts, I studied the IC parts in question (via datasheets and stuff), and came up with a plan for a radio that runs in stereo on both bands:

http://i9.photobucket.com/albums/a77/Rover_Wow/AMFM.png

I know the voltage is sound (4.5-6.0 V), but how good would it work, and how much would it cost to make?

Those writing "popular" (including ARRL) tech books are told not to
include any equations for better or worse. The ARRL books are not bad
as cookbooks but they skip a lot of steps leading up to understanding
why all those parts are there :-).

If you are looking for good readable books that build up from basics
and do not shirk at all from equations/analysis/calculus, try:

The Art of Electronics, Horowitz&Hill, for general electronics and a
tiny bit of radio. Begins to do noise analysis, PLL's, etc.

Communication Circuit Analysis and Design, Clark&Hess, for excellent
RF/mixer/modulator/demodulator stuff.

Tim.

One of the best books, if you can find a copy, is "Solid State Design
For The Radio Amateur" that was published by the ARRL in 1977, written
by Doug DeMaw and Wes Hayword. It covers theory and modeling, as well
as practical hands on building of RF receivers and transmitters. (Why
the ARRL doesn't re-publish this great book is beyond me...)
On a simpler level, any of the the "Notebook" series of books by Doug
DeMaw is a good place to learn about practical RF circuits and radio
design.

Contact Ten-Tec again and see if they have the "Gerber" files archived
somewhere and will send them to you so you can have a board made. Send
the Gerber files to any of the board houses and they will make you a
board to match. May be a little costly for just one board.

I would suggest "Solid State Radio Engineering" by Herbert L.
Krauss, Charles W. Bostian, and Frederick H. Raab, John
Wiley & Sons, 1980. It covers radios for a lot of radio services,
isn't confined to amateur radio practice. Hardcover 534 pp.
Check used book listings on Amazon. Not one for Basic
Training but its not for PhD studies, either. Solid information
(no pun intended). It has nice illustrations. :-)

Source record: 10425

ARRL has announced a design competition that some of you may not have heard of. The objective is to produce a CW and SSB transceiver with at least 5 watts of output on 40 meters. Components must be commercially available. The total cost of all components (except key, mic and power supply) must not exceed $50. Any instruments beyond a multimeter must be in the $50. Complete information is at http://www.arrl.org/qst/hbc/. Credit for the original idea goes to N4AUP/9. All components of the entry must arrive at ARRL by next August. The winning entry will be the subject of a QST article.

I would hope that the winning entry would also appear in the ARRL Handbook and the "Now You're Talking" book. It would also be desirable for this contest repeat every two years, alternating with an SSB/CW transceiver for a single VHF or UHF band, or perhaps for two bands most suitable for working the low-orbit satellites: something worthwhile for new Technicians to build (such a competition might have a higher limit than $50).

The idea that new hams could again build their own stations using money earned after school is very appealing. That was a plausible objective in the 1960s, because of the availability of components from obsolete TVs.

4526. OT - Knight KG-687 Sweep Generator

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-23 04:37:09 UTC
From: Paul P <paulREMOVE@REMOVEppinyotREMOVE.com>
Message-ID: <VR2Rg.397$KK.313@trnddc08>
Source record: 10426

Good morning all. I picked up a sweep generator at a local ham fest. A Knight KG-687 Sweep Generator. I figure that I would give it a try for some tough alignments beloved tube type equipment (e.g.. Hammarlund HX50 Transmitter). http://www.ppinyot.com/hammarlund.htm Restoring and aligning this beast is kicking my butt. Getting the RF amplifier and mixer stages balance ("linearized" or leveled across the dial) over the US allowable BW is very difficult. I am hoping a sweeper can aid me in this effort.

So I went and bought my self two sweepers. The above referenced Knight and an EICO. Both have identical control ranges and functions. But no schematics. Only a Knight Ops manual.

Any help would be appreciated. The Knight is not on BAMA (unless I missed something).

Thanks,
Paul P.

4527. Wanted: ICOM 756ProII Display

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-23 06:45:28 UTC
From: Rick Frazier <rickf@rickfrazier.com>
Message-ID: <rumdnTXIefB9SonYnZ2dnUVZ_umdnZ2d@hawaiiantel.net>
Source record: 10428
Cross-posted to: rec.radio.swap,alt.ham.radio.marketplace,rec.radio.amateur.homebrew

Subject says it all... (or nearly so)

Looking for a 756ProII display, as the one of my radios has a bad one (looks like horizontal sync has gone south...) Icom wanted a bundle and a half to replace it. Want to fix it myself, but don't have access to enough test equipment to debug the one in the radio at present, so looking for a replacement display. Would even consider a homebrew type of solution (currently using the radio as a computer controlled radio, but I'd really like the display to work too...) If someone has information on the actual display data stream so I could homebrew an adapter to convert to a vga or even a laptop display, I'd be grateful...

Barring that, am looking for other sources of the original display. Anyone got one, or a dysfunctional 756Proii that you'd sell cheap? Located in Hawaii, so can't get to the swap meets and such... Best shipping method to here is USPS Priority mail because it's not expensive and gets here in decent time.

Thanks

I have a collection of "wall wart" (others may call them "transformers")
and I'd like to use one to cobble a little power supply. I've never
opened any to see what's really in them (and suspect it'll be quite a
chore), but I'm quite sure they are not ALL "transformers", because some
claim AC and some claim DC output, yet the first I grabbed out of the
junkbox claimed DC AND ALSO provided a HEALTHY AC output on the same
two wires! Furthermore, NONE of them seem to be voltage regulated!
(But if one says "X volts at Y milliamps", then loading it to Y mils
usually gives an output close to X volts.)

So what IS in them? Do the really light-weight ones, for example,
use a capacitor for relatively low-loss voltage dropping? And
why would one give *BOTH* AC and DC? Bad diode(s)?

Those TV's weren't obsolete -- they were "repurposed" -- and don't forget that you had to purloin your grandmother's a.m. radio for a 365mmF dual variable cap.

It depends...

The AC ones are just a transformer.

The DC ones contain a transformer and diode(s).

The cheapies usually don't contain any capacitors or regulators, hence
there is significant AC on the DC.

And AFAIK most of them achieve current limiting by intentionally making
the windings lossy, so you can't burn down your house by shorting the
leads together.

---------- REPLY FOLLOWS ----------

Agreed, those are among the best variable capacitors ever made.

My first radio in 1957 was an ARC-5 a friend gave me. It had a shaft made from a piece of 1/4 inch copper tubing, carefully drilled out so it was a very tight force fit. No glue, set screws or anything like that, just a very tight fit that had to be driven on with a hammer. I used that RX for a couple of years and the shaft performed perfectly.

Hope this helps.

Bill, W6WRT

There are also some transformer-input types that produce well-regulated DC outputs using linear regulator technology, and a growing number of units that use switching regulator technology to make the transfoprmer so small that it's hard to tell from the outside that there's even a transformer in it.. The latter are easily distinguishable because they put out quite a bit of power, yet are smaller and much lighter in weight than traditional units with equivalent power capability.

Such units actually have a bridge rectifier across the AC mains and
supply DC to a switching regulator running at 20-50khz. There is an
isolation transformer running at this frequency (it's core is just a
small bit of lightweight ferrite). The output of the isolation
transformer feeds another bridge rectifier and filter (at ~40khz not
much of a filter is needed, small caps and chokes!). There may then
be a linear or switching regulator. If the later, it may actually
regulate by changing the switching frequency/duty cycle of the
original switcher at the AC mains input. In this case the feedback
is by means of an opto-isolator for safety.

I would take exception to the "windows" requirement for the PC. They
should allow a solution using both "MAC" and "Linux" based PC's
especially the later. Linux can run on a 'throw away' computer that is
now underpowered for current generation Windows OS. Also Linux is FREE
(perfect for a budget project!).

I don't run windows on my computer. Currently running Gentoo Linux, but
for non-computer gear heads I recommend Ubuntu, Kubuntu, or Xubuntu Linux.

4537. Anyone out there can help me with eprom programming?

Years ago in 73, and other mags, programming an eprom for the Icom 22S was the rage.
I now have aquired a TransWorld transceiver that is programmed with diodes. I wish to build a BCD thumbwheel input, with an Eprom for data translation. It's no problem building a board, but it's a problem with me programming the eprom. I don't need anything fancy, no memory, no scanning, just using the thumbwheels to move frequency. I've never programmed an eprom before.

Evidently, you didn't read this requirement thoroughly.

"The software must run on a Windows based PC platform although multi
platform support is encouraged."

I assume this is to make sure a solution is not done soley on an apple or
linux box, thereby leaving out 95% of computer users. I'm a linux
user, but let's face it, not including Windoze would exclude way too
many people. Not good for promoting ARRL programs.

Not too many folks fiddle with EPROMS anymore. Microcontrollers with onboard EEPROM are cheaper and easier to program, plus you get some logic that allows you to reduce the circuit complexity thrown in for the ride. Of course, these things grow ... with the logic, an encoder is cheaper and more pleasant to use than the thumbwheel, but now you would like to add a display .... and on and on. But still, I wouldn't be surprised if the micro, encoder and display wasn't still cheaper than the EEPROM and BCD switch.

..

Error! There are plenty of people using eproms for systems and other
uses. I keep a programmer for such a reason.

A micro like a PIC would likely be a lower cost solution and you can
then uses a cheaper switch and all. A programmer <really more of a
cable> for a PIC can be easily built for a PC parallel port.

There's a control head that comes with this rig, that allows me to select twenty frequencies, along with power, squelch, and other things. I can probably get a board to use the PIC with, however, I know absolutely nothing about PIC programming! Last time I used BASIC was back in the early eighties! There as a project some time ago called the "Kendra Board" I believe in either 73, or CQ, using a PIC.

I am 100% disabled. I can not get a job, so I don't have to worry
about a security clearance.

> Your credit rating matters.

In most cases, but not always.

> And I also note that many of those who are bad credit risks deal in
> cash only...because it is the only way others will deal with them.

I got in the habit of paying in cash about 35 years ago when I owned
a business, and my suppliers gave a 1.5% discount for paying cash within
10 days of the monthly statement being mailed. I paid cash for vehicles
whenever possible to save the finance charges. In 54 years I have
financed one new truck, and one home, 30 years ago. I have no need for
credit, because if I can't afford something, I'll do without it. The VA
takes care of all of my medical needs, and everything else is paid for.
I'm getting old and with my health problems I have no idea how long I'll
be around. Its not the big deal it was when I was 20 years old.

Oh I read the requirements. I meant that I didn't agree with them, and
I wrote an email to ARRL with that opinion. They replied back to me
with your analysis, that they wanted a solution that would be applicable
to most computer users, but they also liked the idea of a multi-platform
project. Maybe they might open up a category for Linux.

The advantage of Linux is that the development tools are free, and Linux
will run on any computer that runs windows. You can also install Linux
on top of windows (on the same computer anyway) and dual boot, so you
can have your cake and eat it too (or have your poison and antidote too
in my opinion!).

> cars.

I applied for a credit card in 1972 and was turned down because I
was an E2 in the US Army. You had to be an E6 with five years to
qualify, so I decided I was never going to waste my time applying
again. The credit card companies have probably spent more trying to get
me to apply for a card since them, than I would have used that Chevron
card for.

I really can't travel very far, so I have no need to rent a car. In
fact, my truck was out of commission for over a week before I was able
to crawl under it and cut the damaged exhaust system apart and fix it.
I asked the young man who volunteers for the "Computers for Disabled
Veterans" project get me a few groceries, but otherwise I didn't miss
the truck. He is learning computer repair, in exchange for helping me
finish more computers.

I have always lead a simple lifestyle. Sure there are lots of things
around, but I rarely buy anything new. Only when I can't fix something,
or build it from what I can find. Its very satisfying to look at
something you've built and have someone ask, Wow! Where did you buy
that? :)

I have picked up a couple truckloads of free angle iron bed frames to
build some work carts, but first, I have to build a welding table. I
have a lead on free reject sheets of plywood from a local mill to make
shelving out of. Any sheet that has a splice, or is missing any glue is
rejected. I want to build some shelving to store the spare computer
parts, and wood trays to hold Hard drives, CDROM drives and Floppy

drives. That way they can be sorted, tested, and ready to drop into a computer, as needed.

BTW, I was given another Compaq like yours with the VGA connector sheared off the motherboard. It works with a replacement AGP card, but you know me. I'm going to replace the connector so I can see if the onboard video is still ok. ;-)

Not entirely true. Linux doesn't always have the hardware support,
especially on newer boxes.

> You can also install Linux
> on top of windows (on the same computer anyway) and dual boot, so you
> can have your cake and eat it too (or have your poison and antidote too
> in my opinion!).

And why would you? Why would you suffer the complexity and frustration of
Linux if Windoze is working just fine for you?

Personally, I fully enjoy having Linux servers an Windoze desktops on my
home LAN, and with the magic of Cygwin, I can have Linux tools on my Windoze
box, and seamless access to my Linux apps, withough fully suffering the
clumsy Linux desktop.

But that is just me. Most folks want to use the applications, not the OS.
Most hams aren't going to write programs, and the features of Linux will be
lost on them, but the complexity sure won't. For them, all they want is a
little Digipan and email, why on earth would they subject themselves to yet
another set of stuff to learn? As far as i can tell, the only ham app on
Linux that is better than what is available on Windoze is gEDA. Everything
else is harder to use and less capable.

Now, I have a lot of ham apps on Linux that I have personally written.
These provide me with functions that aren't easily available on Windoze, and
the Linux environment makes it much easier. But I'm not most people. Not
too many hams are comfortable writing their own applications, or even if
they could, that isn't how they enjoy the hobby. For most people, including
most hams, Windoze serves the purpose.

Everyone has their own set of needs, and one size doesn't fit all. I
suspect there may even be some people for whom the Mac is the best answer,
although I can't imagine who they might be. But the getting in price for
Linux is still pretty high in terms of learning curve, and for most hams,
the return is close to zero. So why bother?

You indicated you had no problem with the circuit. Programming a PIC is more like designing digital logic than it is like programming in BASIC. It may be a little weird, but it isn't the least little bit hard. Its mainly a question of getting over the fear. And as Allison pointed, out, a parallel port programmer is pretty simple. In fact, it's a pretty lame junk box that doesn't already have the stuff. OK, maybe you need to buy the DB25 and the IC socket, but the rest is just any old transistor, and a few resistors and diodes.

> So what IS in them? Do the really light-weight ones, for example,
> use a capacitor for relatively low-loss voltage dropping? And
> why would one give *BOTH* AC and DC? Bad diode(s)?

There are four types I have come across:

1: transformer only for AC
2: transformer and diode bridge for DC
3: transformer, diode bridge and linear regulator
4: switching regulator

The voltage output and the current output of the first two type depend upon the load. So for a type 2, for example, if the nameplate says 6 volts and 500 mA. That's exactly what it means. With a laod of 500 mA, the DC voltage will be 6 volts. a lighter load will result in a higher voltage, and a higher load will result in a lower voltage.

The last two will provide you with a fixed voltage for which they are rated. So, for 6 volts and 500 mA, the voltage will always be close to 6 volts as long as the current does not exceed 500 mA. Switchers may require a minimum current draw of about 10% of their maximum current rating. Thus one rated ate 500 mA needs a minmum load of 50 mA to provide the rated voltage output.

I have disassembled wall warts and used their guts for power supplies in projects. It works quite well. As our town's recycling center is full of old electronics, I have assemble quite a nice selection of wall warts that I use as PSs in projects. And the price is right, zero, except for your time.

Excellent response. I too have a Linux system on my shack computer dual-booting with Winders. I removed Linux from my main computer as after several months of searching I could never find a decent driver for my video card and wasn't about to buy another card when there was nothing wrong with one I have except there aren't any Linux drivers for it.

Plus setting the sucker up is a PITA. Kind of a cross between DOS and Window '98. Finding extensions, plugins, or what ever you may call them is some what like a scavenger hunt and takes a LOT of time and effort.

If one takes the time and endures the learning curve the results are often quite good. The system is very stable and works well.

73,
Danny, K6MHE

Linux- not just for geeks anymore. Mepis distro, even computer illiterates
can use it.

"This is your office app for letters and spreadsheets, this is
your web/file browser, this is your e-mail. Need anything else?"

"No, that looks easy enough."

You can even make it look and feel like "Windows" if they are hesitant to
use something that seems unfamiliar.

I had been on ebray since they billed via postal mail and gave $10.00 credit to start

you out.

Recently I had the wonderful experience of having paid my ebay via Payless Pal and when

I went to pay the small bill.. a few bucks. THEY made an 8 cent error in the

bill transfer and so I figured they would just bill it on the next months cycle.

BUT! What they did was to debit a closed bank account.

I had opened a checking account to get a Payless Pal account and closed

it so my real money was never in jeopardy. So what the idiots had done then was

to bill me an additional $15.00 for a bounced debit they should have never made.

In the mean time ebray has gotten so big I could not get any 'Real response from a

Real person' Like dealing with the government! I could find no Phone number to

call and explain THEIR ERROR.

I just kept getting junk Spam replies from ebray.

It makes them feel good telling me I can not use ebray. pftpftpft!

So I have since closed my ebray account.

AND my Payless Pal account a soon as I heard ebray had bought them.

For several months ebray kept billing me with additional "late charges"

HA HA ebray and Payless Pal get stuffed!

All over 8 cents they have lost a lot more than that in business since I am also

disabled and did shop over 100 items on ebray. It WAS convenient to use

and not walk through so many flea markets and hamfests. My rating WAS over 98%

Couldn't please everyone, and some sent me junk from trash cans smell and all . lol

Thanks for the vent.. off my soap box now and shopping elsewheres. :-p

You closed the bank account that the PP acount was baised on. That was
not in good faith.

So you closed a bank account and didn't tell PayPal? This whole mess is
your fault.

eBay is the best. I've bought hundreds of items worth many thousands of
dollars. Most of it could never be found locally for the same price.
Anytime I'm looking to buy *anything*, I look at eBay first.

Mike

Those of us that have gone through the trouble of getting there know the rewards of Linux. I agree, it's not something for everyone, but I would think that if you have the brains to get a ham ticket and build your own gear, you can figure it out. Also Ubuntu, Linspire (and Freespire) provide a brainless install that usually just works.

As for hardware support, it's much better than it used to be. Almost every sound card chipset found on today's motherboards are supported. Nvidia and Ati both have Linux drivers for their latest video cards (though they are binary drivers and must be downloaded and installed by the end user....complete instructions on the manufacturer's wwebsites). Intel's own graphics chips are supported directly by the kernel.

About the only thing I find lacking is Macromedia Flash support for Linux, though there is a GNU project to provide it (gnash).

The ones I've opened up (mostly to see if the problem was fixable) have
never seemed too adaptable. The the transformers are too integrated
to the plug, or at the very least have no means of mounting them.

I admit that they are useful for projects unopened.

But I find consumer electronics (VCRs, radios, whatever) are often
a better source of small transformers. They at least come with mounting
holes. Of course, a fair number of VCRs I've opened up recently are
using switching supplies.

I tend to bring home switching supplies from computers I see lying
on the sidewalk waiting for the garbage truck to pick them up. But
ironically, I take out the switching supply board, and build analog
supplies inside, using parts I've salvaged from other equipment.
Rare is the time I actually need the current of a switching supply,
or the noise, yet the cases make quite nice boxes for analog supplies.
I leave the AC socket in place, and then just use one of those cords
that plug in, they now being in plentiful supply from other junk
I've collected.

They'd even make nice construction boxes, covering the back panel
with a piece of metal or circuit board.

On the other hand, when I got an older Powerbook some years back,
once I'd scraped up the details for the missing AC adaptor, I pulled
the switching supply out of an inkjet printer and it was the 24 volt
supply I needed, and I had the needed AC adaptor.

Given that this is about a contest about building a radio, in a newsgroup
devoted to the building of radios, I would expect a higher level of interest
in Linux.

But that said, at this point one could even distribute any needed software
along with an existing distribution. Put it on a Live distribution,
and people treat the whole thing like an application.

>

Uhh,why a Transformer,of course..
The ones with the DC output will have a rectifier diode or two (or maybe
even a FWB,if you're lucky) and usually a filter cap,but not always,IME.

The AC ones are usually just the transformer,and that's it.

Some "wall warts" I've come across were actually really tiny SMPS's,you
can usually identify these fairly easily,they're really light compared
to the "iron core transformer" type.. These may be regulated,the
iron-core types above almost never are.

AC and DC output?
Are you sure you're not measuring the ripple? They usually have very
poor filtering,plus after time the cap(s) dry out,and make it even worse.
Or,it could be the diode(s),they've been known to fail aswell.

Nope... closed account ebray opened with that was used long ago.
Was active via Payless Pal till they made a mess of it all so I closed that
account
so they couldn't rob me just for THEIR 8 cents MISTAKE. Plus their
withdraw
penalty, plus their late fees. UGH!
Had they replied with an 8 cent request there was more than 8 cents in
my Payless pal account at the time. Just as reasonable as the Gvnmt LOL

Just the same as auto deposit from anyplace... they have access to get what
ever they want and you have to litigate it to get your own money back.
Being on SS disab' I'd starve before I got my money back if any were taken.
I never trust them with my whole paycheck.... I wonder why anyone does.
Oh!.... That's so they can get in the news by being e-robbed. Phished etc.

Good luck Y'all

I also keep my Norton AV etc up to date and turned on ALLWAYS

Well, its "rating" is "9VDC 200MA",
but my Simpson 260 VOM gives it's output as 15V DC AND 15V AC.

I've NOT looked at the output with a 'scope (yet).

I really don't want to debate this but will add this comment: I did
not find that true with Ubuntu. Try playing videos or mp3s without
addding a bunch of stuff after the install. Its not a slam-dunk yet.

It really a choice thing and we don't all make the same choices. <G>

very 73,

4564. Kenwood TS-940 Power Supply Voltage Regulation

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-25 03:02:09 UTC
From: KC2PIH@gmail.com
Message-ID: <1159153329.322897.293650@k70g2000cwa.googlegroups.com>
Source record: 10265

Hi,

My 940 was working good for while, but now the S-Meter lights and the VFO display have started to flicker. They flicker at random times very quickly (all at once). The LCD display bulbs don't flicker, but they have both burnt out now. And I just replaced them less than 2 years ago (with Kenwood factory replacements).

I checked the voltage to the power amp and it reads 28.6 volts. The S-Meter (lights) read 13.6 volts and when the flicker occurs the voltage very quickly varies from ~6 to 13 volts - never above 13.6 volts. Is this some kind of voltage regulation issue? I can't get it to do this by moving wires around and pushing on things. It does only seem to effect the lights the are controlled by the dimmer switch.

On a side note, I've been reading several posts about the 2N5885 that regulate the 28v supply for the power amp failing and wiping out the MRF-485 transistors that are no longer available. Does it make sense to preemptivly change the 2N5885 transistors to help prevent damage to those MRF-485? I use my 940 daily - and its on most of the day.

Scott,

May I suggest the TS-940 web page? Jeff King ZL4AI / DU7 (N5IW also has
one)
One stop shopping for almost every issue, mod or change noted for the TS-940
The web page is so big -- it is in 2 parts!
http://homepages.ihug.co.nz/~jaking/TS-940_02.htm
http://www.jking.kol.co.nz/TS-940_02_part2.htm#_Toc146779962

The power supply, as you have noted, has been an issue for other operators.
http://www.jking.kol.co.nz/TS-940_02_part2.htm#_Toc146779932
===

Kenwood TS-940s AVR board, by N0XWR on February 28, 2006

You won't find an AVR board for sale new -- you should endeavor to fix the
one you have.

First, check regulator Q103. it is in the rear left corner of the rig as the
rig faces you. it is on the heatsink for the power supply. there are three

regulators side by side. it is the one on the far left. no matter whether you replace it or it is good, it is imperative that you cut the connector off of the three wire harness that plugs on to regulator Q103 and solder directly to it. this harness comes from plug-in #2 on the AVR.

Over time the connector overheats and fails and cannot carry the 20-30 volts to and from that regulator. I have seen the problem many, many times. when the connection to that regulator fails, it takes out Q6 on the AVR board, so check it next.

Clif at AAvid Electronics, (now back in repair business at http://www.avvid.com) helped me get through the problem. also check D3, D9 and D14 which are zener diodes on the AVR board. they can be checked right on the board with a multimeter. the board can be removed easily. as you unplug the wiring harness use a sharpie and number each connector so that you can reinstall it easily. make a diagram, too. use small long nose forceps to unplug the connectors to the AVR board.

Incidentally, Q103 is part # NTE377 available at Mouser. Q6 is part # NTE382 also available at Mouser.

I have the part numbers for the zeners if you need them.

Not true. A fairer statement would probably be something like "there are significantly more free development tools for Linux than there are for Windows." On Windows, the "express" editions of the Microsoft compilers are free, older Borland tools are free, GCC is free, etc. On Linux, there are plenty of commercial development suite, which in many cases are well worth the money.

> and Linux
> will run on any computer that runs windows.

Also not true. Especially with laptops, drivers for Linux are often non-existent. In fact, where I start thinking, "hmm... I should do something with Linux..." the *first* thing I have to consider is whether or not I have a PC around that'll have its hardware fully supported.

I'm not that aware of how many (and how good) developement tools are there
for Linux but...see bellow...

My little story....

I have been told that there are laptops out there, with Windows
pre-installed, that will not even run DOS or Win3.1 any more.

Laptop support for anything other than what software the laptop was
designed for is a major problem.

I have had vastly more success intalling the earlier versions of Linux on
"any" PC laying around. Just like Windoze, Linux has also tightened up its
hardware compatibility requirements and particularly in the driver
category.

I've had, and installed, from Red Hat 4.2 to 5.2, 6.2, 7.3 (problems with
7.4, very buggy GUIs in 7.1,7.2), and mostly failure with one of the
Workstation (Taroon, version 3.0) versions (based on the 3.5 inch
boot disk with included CD-ROM driver portfolio was changed from a small
number of prior CD-ROM drivers to new RAIDs, etc, and the new drivers
don't recognize anything older than about 4-5 years, now). And, I was
profoundly disappointed. Also, that same Linux (Taroon) required 256 MB of
ram to run. It would boot with less (32 mb), but barely get the GUI up.
Anything beyond that would run into the swap partition and be slow as
hell. Actually both 6.2 and 7.3 (which installed sucessfully less often

than 6.2 or 5.2) are pretty good (eg. drag and drop file manager, gFTP, automount-dismount drives, etc). StarOffice 5.1 & 5.2 installed well on 5.2 and 6.2. The problems with 7.3 and prior were the buggy web browsers or they would crash on moderate to advanced websites.

I never set up the firewalls, IP chains, or whatever, and some months after I was running it on the intenet, I got hacked (I actually witnessed it as it was happening: hard drive started cranking like mad, and lots of bytes were being downloaded (as could be seen on the download bytes/sec rate meter and graph). By the time I could get to the phone line to disconnect, the bugger downloaded a rootkit somewhere and every time I booted it up, I could see a package of outgoing data (red bars) leave my box (and without confirming green bars) to some unknown point on the internet. At a later point, I nuked the HD and re-installed.

As an aside, I still run DOS & Win3.1 for a lot of internet aps. At one time, www.securityspace.com ran free vulnerability tests with hack attacks (I think www.grc.com does too) and could not hack my Win3.1 with Netscape 2.01 dialer (probably because it has no ports for anything but email, ng, ftp, and http protocols), but it could hack my Linux and Win98SE boxes (without ZoneAlarm). Most of the time I access my shell account with a DOS terminal program (dialup terminal mode, not ppp). I think my home box is pretty safe that way (not much is going to cross from Unix to DOS, and I don't keep any vital info in files/folders on my shell directory.

Flash working fine here on Mepis 3.4-3.

Even runs my LinkSys WPC54G wireless card when other distros wouldn't.

Wow... someone probably just reefed on a video cable that was still screwed
into the connector and ripped it off?

I would wager that you'll find it will work just fine if you can successfully
re-attach a connector (and repair any damaged traces!)

==================================
Question : Do you run 'Simply Mepis' from a live CD or have you
installed that distro on your HD ?

'Simply Mepis' upgrades come hard and fast ; last month the Linux Format
magazine's DVD carried version 6.0

They shouldn't be coming "hard and fast" from here on out. Mepis is now
Debian-based and will follow that distro's roll-out schedule(s). There
can be/will be security updates -- which I believe is A Real Good Thing.
The updates are done with ease.

But new, full releases will appear less often. 'Tis said, as well, that
Mepis release's will each now come with "Long Term Support". Dunno what
that means in actuality, but I've gotten damn tired of Mandrake
deprecating my installations each time I finally get them fully fleshed
out, fine tuned, and stable. Then it is upheaval all over again.

I will be moving off the Mandrake ("Mandriva" - yeech!) distro (MDK 10.2
on my primary box), and I have recently installed Mepis 6.0 on my
'down-level' box (was MDK 9.1). Mepis 6.0 installed as slick as you'd
ever want an install to go.

Recommended.

There are TWO different flash plugins. Macromedia is NOT supported
under linux. There is another pluging also called flash that is.

Ubuntu tries to be a totally free (as in freedom) distro so they don't
distribute closed source drivers and plugins by default. As you noticed
it's possible but requires user intervention. There are scripts
available to do this for your with one click.

I originally ran it from a Live CD to test it. It found and set up all of my hardware without any messing about or configuring on my part. After a few days I wiped out Mandrake and installed it to the HD.

The only thing I really miss is Midnite Commander...and a partition that got munged when I disregarded previous experience and was bopping back and forth between Partition Magic and QTParted. I could re-write the partion table by hand with a hex editor but it's tedious work and I'm not sure that what's gone is worth the effort.

This machine is set up to dual-boot with Win 98, but the only reason I keep it is for one business app that manages my inventory and invoicing. I'm used to the way it works and too lazy to port it over or try to convert it to something else.

I have the Mepis 6.0 Live distro but this is working fine. It ain't broke, so I'm not going to "fix" it. But if I decide to build a new laptop with one of those nice 17" screens and a dual-core AMD CPU, that is most likely what will go on it.

I and other readers of rec.radio.amateur.antenna would really appreciate it if you'd leave that newsgroup off the lengthy list you post this sort of thing to.

If you're not willing to do that, perhaps some of the people who feel compelled to respond would be thoughtful enough to remove that newsgroup from the list receiving the responses.

Well, this doesn't seem very relevant for folks here in
rec.radio.amateur.boatanchors. We think the requirements
should include being able to bench press a Collins R-390
and being tested on changing coupling capacitors with the
B+ live.

Other folks may consider other tests, for example testing
someone for the ability to hold down the key for ten minutes
straight while shouting "This is my channel, you don't own
this frequency" over and over again. This is a skill that
is becoming increasingly popular.

In small ones (not a whole lot of power; things like 5V at 1A like I
have in front of me), the switcher is commonly a flyback type, and the
regulation is provided by monitoring how far the primary flies back.
The secondary side is a single rectifier diode feeding a filter cap.
Knowing the turns ratio and the expected losses in parts like the
secondary rectifier, you can achieve pretty decent regulation that way.
They commonly run at much higher than 50kHz these days. There are
some small ICs that make the job very easy. One characteristic of the
switchers is that they commonly run on 100-240V, 50-60Hz input, though
not always. It's rarely the case that a mains-frequency transformer
model will operate properly over such a wide voltage range. Wide input
range switchers do make travel to countries with different mains
voltages more convenient.

Cheers,
Tom

The Macromedia flash plugin works fine on my Linux box. You can get it
from:
http://fpdownload.macromedia.com/get/flashplayer/current/install_flash_player_7_linux.tar.
gz

or with this shorter URL: http://tinyurl.com/prmdd

I think it is closed-source, binary only, so it will probably only
work with X86 versions of Linux.

Note that Macromedia are called Adobe these days.

Anyway, thats enough OT for me. This is turning into a
Linux advocacy group :-)

Hi all,

a good friend of mine in IT9 (Sicily) has a very nice General Microwave
Bolometer model 476. By mistake he applied too much power and ...
voila' ... the "476 head" failed.
He has now at least 8dB error. He would like to repair replacing the
TFT element that now has 180 value versus the expected 150 ohm.

The Head is model 42040A ok for up to 20GHz.

Thanks for your help

I know that this is off-topic, but since there are many homebrewer/designers on this group, I will mention it. I am parting out an HP 8557A. This is the one with the LED display.
I purchased it from a local hamfest and discovered that the sweep board had a problem. All of the other boards, including the front panel assembly with the attenuator should be ok.
Let me know if you are looking for any of the board/assemblies and we can work out a reasonable price.

No damaged traces, but someone covered the exposed terminals with
black electrical tape over the HDE15 knockout. The 15 pins aren't too
hard, but removing the two spring loaded mounting clips is the bear. If
the onboard video is bad, I'll remove it and put one of the old DE-9
filler plates over the hole.

4599. Want to buy: Ham Radio Outlet one-knob CW Keyer late 1970s

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-26 16:12:11 UTC
From: Skipp is looking for a cw keyer <skipp025@yahoo.com>
Message-ID: <efbjgrejk2@skeeter.ucdavis.edu>
Source record: 10350
Cross-posted to: rec.radio.swap,rec.radio.amateur.homebrew

Hello there,

Ham Radio Outlet sold a single knob cw keyer in the late 1970's and early 1980's. The front panel control was only the speed adjustment and power on/off. It's a small black painted box about the size of a sardine can and the rear exit wire connections are routed to an iambic style key. Runs of an internal 9 volt battery and has no side tone.

I'm looking to buy one in any condition (even parts of one).

Please just the described "HRO" or "Ham Radio Outlet" keyer is all I seek. I have other keyers in my collection already but this keyer is the missing link from an original ham station a friend and I used to operate. We'd like to duplicate that station now with the original equipment where possible.

Sell outright or trade..? your choice. Please contact me below if you have the mentioned keyer for sale. Please no other spam or solicitations.

thank you

Yes, that's the ticket, back to the past. As if enough people weren't abandoning ham radio already. I have never thought that code was essential. It is just another "hoop" that someone has to jump through. Once I passed the code test, I never used it again. Get real, this is 2006, and with all the innovations on the radio spectrum, code is the last thing on people's minds.

If there is ever a serious emergency, including no commercial
communications, guys like you who can't build a simple transmitter and
companion receiver, and can't do code, will be the first to scream for help.

What makes you think people are abandoning ham radio? I don't see that at
all, but I do see a reduction in new hams. But..... What goes around will
come around. Ham radio will grow again if the ARRL will quit mucking it up
with their friggin yuppy, elitist attitude.

Don

I agree with you on the ARRL! They are the ones who constantly keep
pushing for "code" requirements to be raised! Check the figures on
hams around the country. At a recent South Florida hamfest, it seemed
that I was the youngest guy there!

Well, if that's the case, why not test them on use of the new innovations?

How about making them demonstrate competence operating five different
modes of their choice? They can choose between HF SSB, VHF/UHF FM, CW,
SSTV, fax, RTTY, packet, what have you. That way folks who want to learn
code and might use code have an advantage, but folks who can type 130 wpm
also have an advantage...

Dumbing it down cheapened the license, making being a radio amateur
nothing special. No wonder they leaving.

From: Kerry Miller <kmiller01at@ticnet.com>
Message-ID: <d2nSg.5541$Go3.1040@dukeread05>
Source record: 10366

I've been off the air for several years and am getting back on finally. I have an MFJ-1278B TNC and have used it with a normal terminal program on Windows (hyperterm) and Linux (minicom) but don't have any software anymore that will run on XP or Linux. Is there any software out there that supports the other modes this TNC will do like wefax and sstv? I have used it for rtty, cw and packet but don't have anything that will work with the graphical modes.

Any suggestions? Will any of the sound card software work with a TNC instead of a soundcard?

Thanks,
Kerry, WD5ABC

> Dumbing it down cheapened the license, making being a radio amateur
> nothing special. No wonder they leaving.
==========
Why should anybody be 'special' for being a radio amateur .
AR is for most of us just a hobby ....a hobby involving lifelong
learning on a huge range of radio communications related topics.
It is a hobby for anybody interested in 'Communicating' by radio,
whatever the level of past education.

Sadly a number of AR licensees see the hobby as one reserved for the
'elite' and look down upon those with ,what they consider, a lower level
,even inferior , license.
I fail to understand why superior skills in receiving and or
transmitting Morse telegraphy would make anybody a better Ham
,considering the other aspects of the hobby ,like emergency comms
(mostly without Morse telegraphy), satellite comms , propagation study
,digital modes and ......homebrewing ,just to name a few.

The above referred elitist's attitude towards the hobby is not just
apparent in the USA but also in Britain and many other European
countries.

4618. HHH Update

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-27 13:24:37 UTC
From: Harry Lethall <oeieio@NOSPAAM.hotmail.com>
Message-ID: <efdu2m$kf1$1@news.al.sw.ericsson.se>
Source record: 10369

Hi all,
I have had a bit of a busy half-year, with sickness in the family and the like. But I have managed to add a few new projects that could be of interest to my homepages on http://web.telia.com/~u85920178

Have you ever wondered how these old IF-cans can be re-used? I have two different articles dedicated to them:
http://web.telia.com/~u85920178/begin/cans-0.htm (reusing IF cans)
http://web.telia.com/~u85920178/rx/tda7k-rx2.htm (TDA7000 for NBFM)
http://web.telia.com/~u85920178/blocks/if-txfmr_tube_00.htm (Making your own)

Last month someone asked me how I choose values for components, but "Can you add calculations". Ok, I did it, with a few over-simplifications, and for a crude project:
http://web.telia.com/~u85920178/begin/bug_calc.htm (FM Wireless Microphone)
http://web.telia.com/~u85920178/begin/calc-00.htm (Includes loads of useful calculators)

Earlier int he year I needed to throw together s quick VHF antenna for 446MHz, 432MHz, and again for 145MHz. When I had to do it for 105MHz I created this project:
http://web.telia.com/~u85920178/antennas/vpole0.htm (15-minute +2.5dBd antenna)

Where did those multi-gang tuning capacitors go? I needed one, so I etched it on a PCB, cheap:
http://web.telia.com/~u85920178/use/tuning_caps.htm (multi-gang - for HF/VHF)
http://web.telia.com/~u85920178/use/tuning_caps2.htm (PCB Preset capacitor)

If anyone can help me get the supplier and part number for "hobby time" I couild use a bunch if it ;-)

Best regards Harry

Well, the argument is that you have to do _something_ to ensure that people
licensed are competent operators and have some usable skills. I think the
code requirement is not the best way of doing that, but it's better than
nothing. The only alternative I ever seen proposed is just that, nothing.

So, I am in favor of dropping the code requirement, IF it can be replaced
with something else that helps ensure licensed operators are competent and
skilled.
--scott

But then, I _would_ take a 1940 Chrysler cross-country.

I'll bet that most of the folks "leaving" are simply not renewing being SK. Code is in a way a dying art quite literally. Which is a shame.

We have to face it, this hobby doesn't attract a lot of new blood and the existing stock is rapidly growing older. The advantage to me is that I can find old ham equipment at estate sales for next to nothing but that's not what I'm posting about.. :)

I don't think things are all that "unfair" with the maximum code speed we currently test being 5 WPM. Of course that's what I got tested at so you can charge bias if you want. I currently don't operate CW (heck, I don't operate at all right now) but all that spectrum space in the lower part of the bands is starting to beckon. I've got a code practice program and I work on my code from time to time so maybe someday...

So where do I fall in this debate? I certainly don't favor the removal of the code requirement for all license classes. Extra's surely need to be tested at the current 5 WPM. But the fact remains that the interest in this hobby as shown by the decline in the number of licenses needs some attention.

We don't need to "dumb" down the hobby to get more folks in it, but we do need to bring the requirements into the current age. Before the advent of the personal computer 20 years ago, it would have been very expensive to set up an automated CW send and receive station, but now you can do it for next to nothing. One can actually send and receive CW without ever learning it and get transmission rates much faster than just about anybody can copy by ear, just hook up your PC to the rig load the software and voila, the no code licensee is sending and receiving at 25 WPM the day after he failed the 5 WPM test.

On the other hand, you guys that struggled to get their code speed up to 20 WPM so they could get their Extra have my respect. I understand that lowering that requirement seems like we are dumbing down the hobby, but I hope you can understand that like AM, CW is being replaced by other modes that you and your generation have pioneered.

My greatest fear is that the FCC will totally do away with code in it's testing requirements, which will logically lead to a mass spectrum

reassignment to make more room for voice and we will likely loose our valuable spectrum space in the process. But once the last license goes to SK what's to stop the FCC from giving it all away?

May code never die, there are times it's the only option, but we have to keep the hobby relevant or it will all go away when the hobby dies.

I don't think the code require is necessarily "unfair" somehow, but it does seem awfully "arbitrary" these days. In *today's* world, it's just one mode of many, and a rather unpopular one at that.

> So where do I fall in this debate? I certainly don't favor the removal
> of the code requirement for all license classes. Extra's surely need
> to be tested at the current 5 WPM.

If we're going to make people show a certain commitment to amateur radio before giving them advance privileges -- reasonable enough --, to me it seems that the study should be of something more people are likely to use... say, error correction coding theory, or modulator design or something. Or maybe something even more practical such as demonstrating the ability to perform link planning (antenna selection, power selection, etc.). I imagine one of the reasons CW testing remains is because it is so easy to test compared to those options.

I think I'm pretty much in agreement with you... 5 WPM is not an unreasonable barrier to entry, and I don't particular oppose keeping it around, but I do think it seems awfully arbitrary, and this refelcts somewhat poorly on hams as a group trying to present themselves as modern and professional.

I was under the impression that CW would get through under worse
conditions and/or with lower power requirements than other modes.

Does no one run "flea power" anymore?

I sometimes listen in on 10 meters but don't hear much there. A bit of CW
every now and then, but not much of anything, usually. Maybe I'm listening
at the wrong times? Or is it mostly vacant and just freebanders buying the
10 meter rigs?

Scott,
I took the 1940 Royal Coupe on a mini-cross country trip here in
Florida, managed 60-65 with the overdrive, the original factory AM
radio pulling in at least 10 states, remember those days! Got about
19-21mpg with the old flathead 6, but the 2/60 A/C wasn't really up to
snuff. Once I opened the cowl vent and the vent windows turned all
the way in on us, it became tolerable. Waiting for the winter months
here in Florida to really enjoy the old car.

Well, one of the nice things about code is that you don't _need_ very
much bandwidth. And with modern DSP you should be able to make IF filters
even narrower than my old R-390... should be possible to cram hundreds of
carriers into the space of one SSB channel.

And hey, what's happening to the 500KC marine allocation? That's pretty
much dead... I wonder if the ITU could be convinced to give that to the
ham radio operators. Nobody else wants it.

>May code never die, there are times it's the only option, but we have
>to keep the hobby relevant or it will all go away when the hobby dies.

I don't think code ever will die, but I could see a world in which it is
even less relevant than it is today. That's not to say we shouldn't encourage
its use.

So true, and low bandwidth helps CW get though when SSB would be
impossible. However, don't forget that CW can be done quite nicely with
a cheap computer, some simple cables and some free software without
learning it. I suppose that one could argue that a human ear can hear
what a computer can't, but I'd be willing to argue that point in favor
of the computer.

I'll be willing to bet that there won't be much improvement over CW in
the raw "get the message though under bad conditions" power with the
new digital modes using the same bandwidth as CW. Simple is
under-rated in my book.

As an operating mode CW is alive and well and likely to stay, however
it will be computer driven more and more as the art dies off and new
blood is not required to learn it as well as the old.

Change is neither good or bad, it's just change.

Has much to do with where we are in the sunspot cycle. A couple or three
years from now
10 meters will start to be much busier. It's my misfortune I got my upgrade
to General a year before the dead bottom of the cycle. At the age of 74 I'm
just hoping to be around long enough
to see what the high point in the cycle sounds like.(G)

Yes that can be true. They speak of PSK as being low power but that is only
low transmit power. It takes more power to generate a 25w PSK signal than a
100watt CW signal. Computers draw a lot of power.

> Does no one run "flea power" anymore?

Bad point in the sunspot cycle for 10 meters. It does open occasionally but
not like it does at the peak of the sunspot cycle. Right now it is not open
every day (although it may be open for a while each week). And the time of
day it is open tends to be when people are working, doing errands after
work, etc.

Actually, you would lose such an argument. There are many hams who have
proven that they can decipher better than the computer. The computer
hardware or software requires the following characteristics in the received
transmission to work:

1. A strong signal
2. No distortion on the signal such as occurs from aurora, meteor scatter,
etc.
3. The code sent is nearly equal in quality to that sent by a computer.
Some one using paddles may achieve that but if they are sending with a
manual key or bug, that is highly unlikely.

I have frequently been able to copy better than the computer and my code
skills are quite modest. The only time it beats me is when the code meets
the above three criteria and is too fast for me to copy.

AAARFProducts.com

Any 10 SMA Male to SMA Male cable assemblies for $99.00

RG-58C/U or RG-223/U

Mix & match any 10

Length available: 12", 18", 24", 30", 36", 48", 60", 72", 84", & 96"

High quality & made in USA

Please visit

Enjoy! :-)

Everyone else ought to remember the definition of ham: "Ham is
the butchered meat of swine."

There...now THAT's a troll! :-)

Various digital modes do better under low SNR conditions than CW, but they do require a computer at both ends to perform the encoding and decoding -- some people don't like that fact, that you seemingly need "more equipment" to work such modes than you do with CW. It's a bit of a red herring, however, in that these days pretty much every single amateur radio being sold commercially has a processor (computer) in it anyway, and while some are strictly for "control" (not modulation/demodulation), the percentage that does have raw number crunching power increases every day, and within a decade it's a fair bet that over 90% of all commerical amateur radios will use DSP techniques for modulation and demodulation. (Cell phone went to DSPs somewhere between 5-10 years ago now...)

> Does no one run "flea power" anymore?

Absolutely they do, and it's a really cool part of the hobby... but for every 100 amateurs, I would guess that the number running QRP on a regular basis is about 1.

My sole experience with QRP was accidental. I had reduced power to 5 watts
to tune to a different band (17 meters) and forgot to turn the power back
up. As a result I found myself speaking to a Swiss ham form my southern
Oklahoma shack with 5 watts and getting a reasonably good signal report. I
realize that for real QRPers 5 watts is high power, but for me it was an
unusual pleasure. Moreso because bad weather had me using an indoor dipole
mounted on the wifes sewing room ceiling (about nine feet above the earth).

Man, do anything you can to stick around. It's going to be good, and 10M
FM is just more fun than anything. Get a PRC-8 and take lots of vitamin C.
I predict that this next peak is going to be a really good one, at least as
good as '78 was.

I did, but all of the unit is up for grabs. It is a nice 60dB attenuator. I've got all of the board in a box.....probably, I will end up taking it to a hamfest if I don't sell the parts sooner. The LED readout board seems to be the same as on my 8558, so maybe I will hang on to that.

Signal to noise ratio would be important, to be sure, however with the
proper application of some limited computing power I'm sure one could
construct a detector that would work with seriously low SNR. It is
amazing what DSP's can do now days..

> 2. No distortion on the signal such as occurs from aurora, meteor scatter,
> etc.

Again, I've seen spectral displays that clearly show CW transmissions
that could *not* be heard.

> 3. The code sent is nearly equal in quality to that sent by a computer.
> Some one using paddles may achieve that but if they are sending with a
> manual key or bug, that is highly unlikely.

Sending code is not in question. Surely a computer is able to open and
close the keying faster than a transmitter can possibly transmit.
Also, remember that the faster you key, the higher bandwidth your
signal will require and the higher the SNR will theoretically need to
be for it to be decoded at the receiving end.

> I have frequently been able to copy better than the computer and my code
> skills are quite modest. The only time it beats me is when the code meets
> the above three criteria and is too fast for me to copy.

I would contend that the software you are using is not utilizing the
inputted signal at it's full potential. I've seen audio processing
techniques that could pull out inaudible signals that where more
complicated than CW would be.

I would also ask if you where copying random characters or where you
able to "fill in the gaps" by using the context? The latter would be a
very different problem for a computer to solve.

> > I'll be willing to bet that there won't be much improvement over CW in

> out?
>

I'm saying that if you pick any digital mode, restrict the bandwidth to
that of the CW signal with the same data rate, keep the SNR the same
with the same error rates, CW will be about as good as you can get.
Not bad for an operating mode that has been around as long as CW.

> instead of a soundcard?

I bought one of these some years back. I made the same search you did and came up empty-handed. I've been happy with Baudot and VHF packet so never really got too serious about the other modes.

I did hook up the accessory audio I/O on my rig to the soundcard in the computer, with the intent of making unattended recordings (for AM BCB DXing - works great!) and using the computer as a voice keyer. Turns out the same connections are appropriate for PSK31 and other soundcard modes. Very simple (one transistor, one resistor) serial port interfaces are possible to let the computer PTT the radio, or you can even buy one preassembled, and if you don't have a soundcard they're pretty cheap.

I still use the 1278 for Baudot.

Define "common operating conditions".

For a contester, common operating conditions often include murderous QRM.
Yet contesting is common. I've always maintained that one can construct
various scenarios such that there is one where the particular mode under
discussion is "the best".

For ragchewers, common operating conditions often include manually sent CW.

Yes and there are some very fine software programs already available. But
even so they fail before the "EAR" fails, assuming a trained and experienced
operator.

>> 2. No distortion on the signal such as occurs from aurora, meteor
>> scatter,
>> etc.
>

> Again, I've seen spectral displays that clearly show CW transmissions

>

So I've seen displays of many types of signals that cannot be heard. That is an entirely different issue from distortion. When the auroras start playing, PSK (as an example) is so distorted that no matter how strong the signal, the computer cannot decipher it. If a CW signal is distorted but loud enough to hear, the human ear/brain combo can still decipher.

Receiving is the issue. If the received code was manually sent, the computer often fails.

I''ve tested everyone I could find. I'm one of those people who gets pleasure out of trying all the new gadgets & software I can find and afford. I've also seen inaudible signals pulled out of all kinds. That's quite feasible when the bands are in good shape. Add a little thunderstorm activity, geomagnetic disturbances, solar flares, etc and the machine can't decipher them. It's not a matter of signal strength but a matter of signal quality.

> I would also ask if you where copying random characters or where you

Yes it is a different matter. Humans definitely have the edge on "fill in the gaps".

>

Ok, I understand. Actually many digital modes are, by their nature, narrower than CW already. You would have to open up the filter to get to the same bandwidth. Again the key item is quality of signal. For example, aurora induces phase shifts on PSK (phase shift keying) and makes it undecipherable. It also induces phase shifts in voice and CW. It gives the voice & CW signals a buzzy, raspy sound. Yet you can often understand voice when PSK is undecipherable. CW, when there is a phase shift, sounds like a series of buzzes but can still be copied if you are used to it.

And yes CW does a fine job and will continue to be advantageous under certain conditions.

Source record: 10314

Hello All,
I was going through an ADC tutorial and realized that they use the term input bandwidth more frequently as one of the important factors to be considered before choosing an ADC.

Based on my search, I found out that "the input bandwidth is something that determines the maximum bandwidth of an input signal that can be accurately sampled, regardless of the stated sample rate".

http://www.diamondsystems.com/slideshow.php3?name=ADBoardTutorial&page=4

I am not sure why is this input bandwidth different from Fs/2. From the above link, one of the example has Fs/4. Is it just because to increase more precision that we use a sampling frequency 4 times the bandwidth of the signal?

I assume for practical reasons, we oversample it but that is for more precision (correct me) but the Nyquist criteria still holds good for sampling the frequencies upto Fs/2. That means I can still get the original signal. I am not sure about the accuracy though.

Also, can I say that if an ADC is oversampled 4 times the Nyquist rate (Fs = 4*BW), then is my input frequency given by Fs/4? Assume single channel case.
Correct me if I am wrong.

Thanks for your responses.

>
> I am not sure why is this input bandwidth different from Fs/2.

It's really two different bandwidths. Fs is determined by the bandwidth of the signal. If you filter a 10MHz passband from a 1GHz signal, your Fs calculation is based on the 10MHz of signal (if you choose to undersample, which would clearly be to your advantage in a case like this). However, since it's up at 1GHz, even though you might be able to use a Fs > 20MHz, the ADC must have a sample and hold bandwidth > 2GSps.

If your input signal has components from DC up to your desired signal, then the two bandwidths are the same.

25 years? Probably about the same, since repeaters had been around
at least 10 years by then. You could by a repeater over the counter
with tone squelch, and several other toys built in, so they were no more
complicated than a 2 meter handheld. My high school Amateur radio club
built a two meter repeater of of Motorola and GE strips, homebrew powers
supplies, diplexer, and timers in the late '60s. What is the big deal,
unless you have multiple sites and voting receivers? We were just a
bunch of RF crazy teenagers with less than $50 to spend, and we wanted
to build a repeater. A few months later we were given a surplus WE Touch
TOne decoder module, and added a phone patch.

Like everything else the club did, we raised the funds by repairing
old electronics and selling it to buy the parts we needed for the next
project. the only new piece of equipment we ever purchases was a HW-16,
in kit form. BTW, CW was the least used form of communications from the
club's station. they could do that at home, but we had some nice
antennas, the two meter repeater, and several full coverage HF rigs.

4667. ARRL "Homebrew Challenge" NOT about Operating Systems

Newsgroup: rec.radio.amateur.homebrew

Folks, all this stuff about Operating Systems is interesting, but it
doesn't apply that much to this "Homebrew Challenge" insofar as
the radio part of the radio station specified in the contest.

For only $50 in New Part cost, what does everyone think about
for the actual RADIO hardware?

Just curious...I have no interest in that contest...just a curiosity
of what might come up in the next year.

Source record: 10319

The Nyquist sample rate of Fs/2 is the minimum rate at which you can sample and theoretically recover the exact original signal. It's only theoretical, though, because recovery of the signal from the samples would require a perfect, "brick-wall" frequency response, flat phase response, low pass filter. Because we're stuck with using real filters, we have to sample at a considerably higher rate if we want to recover the original signal. Just how fast you have to sample depends on how good a filter you're willing to construct and how much distortion in the reconstructed signal you're willing to tolerate.

The bandwidth of an ADC can be limited by things other than the sampling characteristics, such as internal circuitry and packaging. For that matter, the distortion can also greatly exceed the amount determined only by quantization error.

Their goals of homebuildable and as cheap/functional as possible are in conflict. A starter homebrew design should be more modular, rely less on overloading of components for multiple purposes, include guidelines for substituting any expensive or rare part with found alternatives. It would not be concerned about requiring one of a part you can only readily get in bags of 10 or 20.

The cheapest possible starter 40M CW/SSB radio would probably be a kit, not built from a collection of overpriced Radio Shack components. It probably does a lot of work in the digital domain, without regard to ease of modification. It's built on an etched PCB mass produced in such quantities that it's cheaper than bare copper board at the local electronics store.

Hey all,

I read about people using their sound card to catch transmissions
from dedicated senders such as SAQ by just hooking a roll of wire to the
mic-in and apparently finding some success in this. This got my wondering,
what aside from laws and fines is stopping me from hooking my 80W
stereo amp up to some sort of antenna for global transmission fun?
Somebody must have thought of this before...

It's cheaper to use your car alternator as an LO.
Upconvert by using the transmission as a mixer
and the gear shift knob as a band selector.
FM by riding up or down steep hills in a 2-cylinder Citroen.

Better yet, fax them copies of invoices of connector purchases from
competitors. Telling them "I'm not buying your product" means
nothing. Telling them "Because I hate your advertising, I am buying
your COMPETITOR'S products" means more.

Now that would be something. DX licence or driver's licence? Hehe.

Too bad I don't have a car. ;)

I agree, but I also think many will rise to the challenge, even though the prize is modest. Look for some very clever things--mostly done with IQ phasing techniques. I personally plan to enter with something, and suspect others on this list will as well. Also expect an even better project to follow that builds on all the best from the contest...I'm most interested to see what sort of frequency synthesizers/VFOs come out of this. I'm personally hoping ARRL gets enough entries that they can publish a book or something, and am hoping this will inspire some wonderful new kits and other things for newbies.

My design will not use IQ, will have a DSP (probably one of the Microchip 30F4013s in a DIP pkg), but I haven't found/invented a VFO scheme I really like yet (yes, I know the contest allows you to be rockbound, but I'm shooting a little higher). I'll try to set up a brag page and post progress.

I appreciate the time given for this contest--even with very spare time people should be able to do something. I suspect ARRL's lab will have their hands full testing everything that comes in (maybe they will only test the finalists).

What fun!

They are different because they are two completely different things.

In a successive approximation or flash ADC the signal sampling happens over a very brief window, so aliasing happens over a very wide band. This means(for instance) that you could sample a signal at 10.25 times the sample rate of the ADC and have it come out at 0.25 Fs, assuming that your sampling jitter is small enough and your signal is intact going into the sampler at that frequency.

The input bandwidth of the ADC is just the bandwidth of the ADCs circuitry leading up to the sampling stage. In principal it could be just about anything. In practice SAR and flash ADC's have relatively wide input bandwidths, while sigma-delta and slope converters have input bandwidths closely matched to the sampling rate.

Theoretically the Nyquist criteria holds up to Fs/2. Practically you need to oversample at much greater frequencies than that, or sweat blood on your anti-alias filters.

> Also, can I say that if an ADC is oversampled 4 times the Nyquist rate
> (Fs = 4*BW), then is my input frequency given by Fs/4? Assume single

You can say that your bandwidth is given by Fs/4. Your input frequency
depends on the characteristics of your input signal, which may be quite
different from the characteristics of your input filter.

What is stopping you?

Well, the laws of physics for one, but you're welcome to give it a
try. You'll find enforcement of those laws is pretty strict. :-)

Hehe. Well yeah, I figured as much, but why doesn't it work? Too high impendance? Why is that something the amp can't handle, if I maybe resist the urge to crank it up to eleven?

I'm approaching the issue from the engineering perspective, but I don't have much knowledge in this particular field. If you can enlighten me I'd be much obliged. ;)

Engineering is the application of physics. An "engineering perspective" is one that starts from knowledge of the basic physical principles involved, and uses mathematics along with that knowledge to produce a design or solve a problem. I've seen no evidence of either in your approach. Whatever you're doing, it's certainly not engineering.

The main problem with what you propose is that the electromagnetic field you create with the amplifier will be small to begin with, and it will be attenuated rapidly with distance for a number of physical reasons. But don't take my word for it. Crank that dude up, and don't stop at 11. Broadcast your telephone number and wait for the phone to ring.

Hm. I was a student of IT on a polytechnic... The basic state of mind one
needed there was that we don't need to know all the facts by heart, but we
must know where to find them.
In this case through a few degrees of separation I had specs which say
that it doesn't need to be efficient; it only needs to work. Then when I
have it working I can begin identifying bottlenecks and come up with ways
to widen them.

Good info on magnetic field strength there, thank you. It gives me a good
idea of where to start looking and comparing.

I'm not going to experiment just yet since I'm not a radio amateur, though
I'm vying for a licence. The radio-regulatory authorities here in
Finland don't have much to do, so I'm not going to give them a reason to
hunt me down. :o)

No. The problem is that wavelength of a, say, 10kHz signal is 3km in free space. You need to have an antenna that's a decent fraction of that length for the antenna to look "distributed" enough (that is, the phase of your 10kHz signal at the far end of the wire is significantly different than that at the near end) in your to start getting any radiation. You can go through the math for all this -- look up the input impedance of a short dipole on Google -- and you'll find that the radiation resistance of a reasonable length speaker wire is probably going to be in the milliohms, yet the finite (real) resistance of the wire is going to be 10-1000 times as much, and the reactance will be as well. Hence, all three parameters are against you: The high reactance will keep the amps from being able to put much power into the cable in the first place, and of what does get there, the vast majority will be eaten up as heat rather than radiating.

To make matching tenable (so that you can actually get power into the cable), you need a *very* long wire. To make things efficient, you need low loss conductors -- nice, thick metal rods. Hence, doing a good job becomes rather spendy, and thus you don't see that many people outside of the military building VLF systems.

I think I'd almost suggest trying something like a 1.3GHz moonbounce system prior to building your own VLF transmitter...

4686. Help calibrating a noise source

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-09-30 02:26:00 UTC
From: "Gary, WB9JPS" <gwj@spamcop.net>
Message-ID: <1159583160.221099.124060@c28g2000cwb.googlegroups.com>
Source record: 10337

I built a noise source as described by Bill Sabin, W0IYH in QST (1995) and EMRFD. Works fine, but now it's time for calibration. Chatting with Bill, he reinforces the notion that the best way to go is comparison with another calibrated source, or a direct measurement with a calibrated noise figure test set. NoiseCom used to provide this service to hams for <$50, but now they claim they have dropped that offer (it's about $600, now). So my question is, is there anyone in the SF Bay Area (I live in Livermore) who might be able to help? If someone owns a source or test set, perhaps we could get together. I'm open to other suggestions, too.

FYI, this is primarily for testing HF rcvr performance. I'm building an R2-style DC rcvr, and it's turned into a nice research and education project, so I go a bit overboard sometimes, but it sure is fun. I'm also using an IQPro DDS VFO. I wrote a couple reports on its performance that are up on the AA0ZZ website.

This is my first post to this group. There seem to be a lot of talented folks lurking out there... Thanks in advance for any help.

73,
Gary, WB9JPS

>Somebody must have thought of this before...

At least previously, the frequency tables started at 9 kHz, so
anything below that would not cause any interference to any other
service.

However, the problem with VLF is that any practical antenna is going
to be very short compared to wavelength and since the radiation
resistance is proportional to the square of frequency for antennas
well below 1/4 wavelength, most of the power injected into an antenna
is going to be dissipated in resistive losses.

At the LF aeronautical beacon band with 90 m antennas, the antenna
efficiency based on measurements flown around these beacons seems to
be about 1 %. In Europe, the maximum _radiated_ power limit on the 135
kHz amateur radio band is 1 W, but generating that kind of radiated
power with reasonable sized antennas (30 m) would require at least 1
kW of transmitter power, indicating that the practical antenna
efficiency is about 0.1 %. At 13 kHz, the efficiency would be about
0.001 %.

The near field distance for a simple antenna extends to about 1/6
wavelength, so at VLF, the practical communication range for amateur
communication systems would be well within the near field.

Since you are apparently from Finland and since the Finnish
telecommunication law only grants the jurisdiction to the
telecommunication authorities for "freely propagating" electromagnetic
radiation, my interpretation of the law is that it does not cover any
near field i.e. magnetic or electrostatic communication systems, in
which the near field communication systems work.

Of course, if you are able to generate huge magnetic or electric
fields that cause interference to other systems, this may cause
problems to you.

But otherwise, go ahead with your experiments, but unfortunately the laws of physics will hit you sooner or later :-).

Thanks, that's what I was afraid of. I, too, use it for rtty, packet,
amtor, pactor, etc. but I was looking for a way to use the fax and sstv
modes. It sounds like I might be out of luck, maybe I can find a sound
card program to do those modes. I guess worst case I could find my old
software and load up dos on an old machine if I can still find it all.
MFJ doesn't seem to support it anymore, they don't seem to have any
windows software for it.

Thanks,
Kerry, WD5ABC

If you can't get a calibrated comparison noise source, here's
some tips on workshop calibration techniques on random noise:

Random noise voltage or current can ONLY be calibrated by
a TRUE Root Mean Square measuring instrument. By "true" I
mean a thermionic type such as an RF power meter (thermistor,
bolometer, etc. sensor). Few voltmeters on the market have
TRUE RMS measuring capability; those that do are specified
as such and rather on the expensive side.

A very low-level random noise source can seldom be measured
directly by an available-market voltmeter or power meter.* To
calibrate it with such instruments requires amplification. A
receiver can provide that - provided - it is carefully checked
for linearity. By linearity I mean one that does not clip or
saturate the RF or IF or detector. A wideband TRUE RMS volt-
meter can measure the last IF output and do a comparison
between IF signals from a signal generator and the random
noise source into the front end. If the front end noise is
significant, the total noise input-equivalent will be the
good old square root of the sum of the squares of the noise
sources; knowing the true RMS values of both and just one
will let you find the true RMS value of input noise voltage
of the unknown. [kind of nuisance grunge work but then
most metrological work <calibration> is of that nature :-(]

* Jim Williams of Linear Semiconductor had a nice article in
EDN a few years back, pushing a Linear Semi true RMS IC. In
that was a list of available "RMS implied" voltmeters with
their sensor types stated. The cheapo averaging circuits in
common multimeters could be LOW on true RMS voltage readings
down to half of readings (despite their stated accuracy
specs). The Linear Semi IC apparently didn't sell well and
was taken off of active production. Perhaps only National
Semiconductor has a rough equivalent?

>This is my first post to this group. There seem to be a lot of talented
>folks lurking out there... Thanks in advance for any help.

Living in southern California I don't get up to mid-state
often. Difficult to drop over with a comparison source.
:-) However, a bunch of us lurking in here have been
"around the horn" a few times and we can supply a few
items of information to help. [or maybe to add to the
"random noise" level? :-)]

Woha. A lot of info to assimilate. Thank you.

A few quick questions; the efficiency at higher frequencies does only increse logarithmically, correct? Around where is the 'knee' where increment of frequency no longer provideas a significant increase in efficiency? - Ballpark numbers and guesstimates are perfectly OK for me, since I'm only curious of the general idea.
Finally, what exactly do you mean by 'near field'? Is it an arbitrary line in the sand that separates near fields from normal fields, or a completely different physical phenomena?

Sort of, but not really. It's linear for electrically short antennas, but it's actually oscillatory in nature (albeit this occurs after you've hit a half wavelength -- not something you're likely to do at VLF).

> in the sand that separates near fields from normal fields, or a completely
> different physical phenomena?

Any element that you're pumping energy into creates an electric and magnetic field. In a non-radiating component, that energy just "flows" around the element, e.g., the magnetic field diagrams you're probably familiar with for something like a solenoidal inductor. "Near" and "far" field aren't necessarily precisely defined terms, but the idea is that that energy that's just flowing around the element is in the "near field" whereas the energy that's actually radiating out towards Alpha Centauri is in the "far field." As a ballbark estimate, the near field of an element is within about a wavelength away (in distance) from it... hence the mention that, at 10kHz with a 30km wavelength, anywhere in your home is within the near field.

Mathematically, if you look at the equations for a dipole, the electric and magnetic field look something like E(r) or H(r) = foo/r+bar/r^2+bar/r^3+... (where r is the radial distance from the dipole), and hence the power in the field (the Poynting vector) is something like P(r) = baz/r^2+quux/r^3+... From this equation, you can see that over large distance the only term that matters is bar/r^2 -- this is the far field radiation. (Another way to define near field vs. far field, in fact, is to solve P(r) for r when the baz/r^2 terms equals quux/r^3+... -- reasonable enough, as at that point, the far field energy flux is equal to the near field energy flux.)

The above is a fair amount of hand-waving and probably some of it is just plain wrong :-) -- you really should pick up a book on the topic or start Googling. Krauss' books are excellent, by the way, in that the exercises are often "real world"-based, meant to demonstrate either how something really does work or, if it isn't practical, why not.

The Germans call near-field and far-field the Fresnel-region and the Fraunhofer-region, which is really a lot more colorful IMHO.

Not too long ago, I got an HP3400A (10 MHz bandwidth) on eBay for the purpose of measuring noise. Don't recall what I paid, but it was very reasonable. Since truly random noise also has low-frequency fluctuations, an RMS meter reading wanders quite a bit while measuring noise. I find it easier to eyeball interpolate an average reading with the analog meter of the HP3400A than with a digital meter.

Sorry I can't help with a calibrated noise source from this side of the Atlantic. The amateur microwave community hold regular meetings that always include a measurement session using calibrated professional test equipment. Given a calibrated professional noise source and a NF test set, it is very easy to transfer the ENR calibration to your HB source (especially if the room temperature happens to be 290K :-)

However, you don't really need a professional test set. You can make very accurate measurements of relative RMS noise power levels using a PC sound card, and this opens the way to NF measurements. The only hardware accessories needed are a simple linear downconverter of the type described in EMRFD, and a noise source that can be gated by an output from the PC. For details and software, see:
http://uk.geocities.com/g8kbb@btinternet.com/newfile4.htm

The only other issue is that almost all professional noise sources are designed and calibrated mainly for UHF/microwave use. For your HF application, you'll typically be limited to just one transfer calibration point at 10MHz. You can rely on a professional source to have no nasty resonances between calibration points, but the ENR will probably roll off rapidly below 10MHz owing to the relatively low value of the DC blocking capacitor.

4703. Cheap, Small TNC?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-01 01:54:50 UTC
From: Bill Powell <whp@att.net>
Message-ID: <ef7uh2981hroj8e87s6je8uat15in9o3l8@4ax.com>
Source record: 10203

I was working on designing a surface mount PC board to build up a bunch of Bob Ball's nifty $25 PIC-based TNCs together so every RACES radio would have one built-in. . . and then read the source code and discovered it doesn't do AX.25 connected mode!

Any suggestions for a TNC that:
- Is cheap enough I can afford to give away 20 of them,
- Is small enough to install inside a mobile radio,
- Is AX.25 connected mode capable,
- Is NOT KISS or APRS (UI) specific,
- Is NOT dependant on ANY PC interaction or support,
- Will digipeat.

So far I can't find anything that meets all those requirements. We are currently using a limited number of Alinco internal TNCs but they are expensive, don't digi and only work with Alinco radios.

And - NO - I'm NOT looking for a different way to do what I need to do: it's Plain Old AX.25 connected mode; NOTHING ELSE!

Thanks in advance,
Bill - WB1GOT

I need a time base plug-in for my Tek 7704 main frame scope.

The 7B53A plug-in is described as a "Delayed/delaying time base in one". The 7B71 is descried as a "Delaying time base"

Can someone tell me the difference? Tnx, Jim.

Bill -

The NO KISS specification I think eliminates the John Hansen products ?

He now lists these under the name Coastal ChipWorks - TNC X solution
http://www.tnc-x.com/

You can also ask John of his thoughts (his designs are also PIC based)
His TNC-X boards are expandable via an expansion header that allows the
addition of "daughter boards".

>efficiency? -

You can model the antenna system as a series connection of a loss
resistance and the radiation resistance. The loss resistance will
convert the RF power created with your expensive gear into heat :-),
while the power "dissipated" by the radiation resistance will actually
disappear as EM fields.

For full sized antennas, the loss resistance is small compared to the
radiation resistance and most of the RF power generated will actually
radiate. However, even with 1/4 wave vertical antennas, the ground
losses can be significant, if not ground planes are used, but the
antenna is grounded with grounding electrodes.

When the antenna size is below perhaps 1/10 wavelength, the radiation
resistance drops by the square of frequency, so the radiation
resistance can quite easily be well below 1 ohm at LF and below. The
loss resistance (include grounding and loading coil losses) can be
several ohms, thus the majority of the generator power is dissipated
in the losses and only a very small part is actually radiated by the
very small radiation resistance.

While the metallic conductor skin effect losses are proportional to
the square_root_ of frequency, the ground losses are harder to
predict, so the total efficiency at VLF frequencies is almost
proportional to the square of frequency (not logarithmic). The 'knee'
would be at 1/4 wavelength for a vertical antenna. At even higher
frequencies, the radiation resistance would vary cyclically.

Everywhere I read about the necessity to remove AM. If the band is used for
FM only, why then remove the not found AM in it?
I ran a simulation with Spice doing FM demodulator concepts comparision. The
difference between limited and not limited FM product detector was not of
significance. Doing the correct low-pass filtering after the detector was of
much higher importance.

A digital detector will have problems if the SNR is to low! If the SNR is high enought, the all-digital system is just simpler to realize and consumes lower power.

The limiting has nothing to do with receiving FM, it has everything to do
with getting rid of QRN.

Armstrong pursued FM because he wanted some system that was more noise
free than AM. Since FM does not have an amplitude componenet, that means
you can limit to clear out the QRN and some of the fading. The limiting
is what makes FM so appealling. Take out the limiter and the FM demodulator
will still work fine, but there'll be little point in switching to FM.

------------ REPLY FOLLOWS ------------

Here's what is working against you:

1. Frequency is too low for the power level you are using. At higher
frequencies in the shortwave region, 80 watts is plenty to talk around
the world, but not down in the audio range.

2. If you did have lots of power, you would still need an efficient
antenna. Unless you own an entire county, you won't have enough room
to put one up.

The US military does use very low frequencies in the audio range to
communicate with submarines world wide, but they have a pretty good
budget for it. :-)

It can be done, but not by you or me.

I agree there on analog display versus digital.

Dug out my CD of old "saves" and found the Jim Williams article
in the 11 May 2000 edition of EDN (www.ednmag.com). In that
he lists the following as having zero error when compared to using
the Linear true-RMS IC: HP 3400, 3403C, 3478; Fluke 8920A.

By the bye, the 1967-era HP pseudorandom noise generator has
the following "calibration" procedure to check RMS output voltage:
Connect it to an HP digital voltmeter-recorder, set it to slow
speed and record 1023 voltage readings (corresponding to the
slow-speed 'flat' pseudorandom waveform parts), then take the
sum of the squares of all those readings and find the square root
of it. Heh heh heh...I can just see a calibration technician doing
all that work with a mechanical calculator in the 60s...with the QC
chief storming in after an hour or so asking "You STILL working
on that?!?" :-)

> . . .

Neglecting ground effects, the radiation resistance of a four-sided loop 100 meters on a side at 100 kHz is 45 milliohms. The radiation resistance of a four-sided loop 10 meters on a side at 10 kHz is about 400 picoohms (4 X 10^-10 ohms). If you used 2 mm diameter wire to construct the loops, the first would have an efficiency of 0.7%, and the second of 0.00000016 percent. These are very optimistic, since they don't account for the considerable loss you'd incur by induction into the ground and objects for quite some distance around. They also don't account for losses in the required impedance matching network. And a receiving antenna would have the same efficiency.

You can easily get these numbers with the free EZNEC demo program from http://eznec.com. Or use a calculator and the simple equations you'll find in any antenna text.

The OP wondered if anybody had ever thought of this before. The answer is yes, the first time probably well over a hundred years ago. Anyone doing the simple calculations sees immediately why it's not a great idea.

OK Michael. So it is for fight against QRN and fading, not primary for being
immune to AM.
As my Spice simulations suggest; the FM demodulator works almost completely
comparable in analog (=not limiting) and digital (=limiting) mode.

What about the performance comparision of PLL demod and quadrature demod
concepts? Seems no much difference?

From a practical standpoint, I can't see much difference, unless OP has some specific software beyond the typical terminal emulator. The TNC-X works quite nicely from a laptop and a mobile (haven't tried it with a hand held). And consume little power.

However, they don't digipeat without the addition of a daughter card, and that would drive the price up, maybe too high

..

WOW.

$50 today is like $10 when I was first licensed 30-something years ago.

$50 is just five more dollars than what the 2007 ARRL handbook
(paperback) is going to cost!

Tim.

Yes, I'm beginnig to see that now. :D However, I am learning a great deal
in the process, and the equations I have found to explain the issue in
detail don't seem simple at all. But if it was simple it wouldn't be
interesting, now would it? ;)

Right now I'm looking at;
http://en.wikipedia.org/wiki/Near-field
http://en.wikipedia.org/wiki/Radiation_pattern
http://en.wikipedia.org/wiki/Fresnel_zone

Lucky for me I'm trying to build up an interest in math. Cos here's plenty
of it...

Again, thank you all for your replies. It'll be a while until I really
have an intuitive understanding of the subject like you all do, but I am
patient. :)

That is an interesting perspective.

My first handbook, the 1971 edition, had a $4.50 cover price. It
was preceeded, by about a month, "How To Become A Radio Amateur",
and I can't remember how much that was but obviously not much.

The latter book had a single tube transmitter built on a wooden
"chassis", though I can't remember if they suggested you scrounge
the parts. I have no recollection of the receiver, but it would
have been a regen.

To get the numbers I came up with, all you need is the equation for the radiation resistance of a small loop and the resistance of copper wire. It shouldn't be hard to find the equation for the small loop, and it's very simple. At those frequencies, the resistance of the wire should be nearly the same as the DC resistance, so all you need is a copper wire table(*). Both should be readily available on the web.

Of course, if you want to know about other kinds of antennas and more detailed effects like the field intensity in the presence of ground, the equations can get difficult indeed, and some are too difficult to solve directly. That's what the modeling programs are for.

(*) At higher frequencies or with much larger diameter wires, you'll need to account for skin effect. This requires calculation of a square root and can be done on a pocket calculator as can the others.

Small magnetic loops with gains in -30 ..-60 dB range can be usable
for receiving due to the extreme noise levels on LF and VLF, but for
transmitting, they are far to lossy.

To get any significant communication distance, you would need a
vertical polarised signal. The popular antenna among 135 kHz
experimenters as well as in LF aeronautical beacons is a vertical
tower with as much top capacitance as you can put up.

Look at the antenna systems of old ships using the LF band, these have
multiple parallel wires erected between the masts in the bow and
stern. These wires form the top capacitance and a vertical wire going
directly from it isolator on the radio room to the top wires, which is
the actual vertical radiator. The top loading will increase the
current in the vertical conductor and hence vertical radiation.

The 7B71 is a single time base, which can be used as-is, or to provide a delayed trigger to a second time base plugged into another hole. When one timebase is used to delay another, it allows seeing an expanded-time closeup of a part of a waveform.

The 7B53A is a dual timebase -- two timebases in the same package. One can be used to delay the other, so you can do the whole thing with the one plugin.

4724. Trouble matching SA605 input at 434 MHz

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-02 07:11:57 UTC
From: David <dhuisman@bigpond.net.au>
Message-ID: <1Z2Ug.39931$rP1.16940@news-server.bigpond.net.au>
Source record: 10224

I am having trouble matching to the input of a SA605 at 434 MHz.

If I apply a sig gen directly to pin 1 via a 1n cap I get around - 95Bm sensitivity. I then add my match and the sensitivity drops more than 10dB. I am expecting 10dB increase in sensitivity when input is matched correctly.

First I tried matching to 800R as per input impedance listed in the Philips APP note. I then noticed most applications matched to 1k5.

My current circuit is C-Tap (33pF to ground and series 5p6 to inductor).
18.5nH inductor (Q = 100) across input pins 1 and 2.
10n decoupling cap from pin 2 to ground.

Any help much appreciated.

Regards

David

4725. FS ABE Elettronica L60 UHF amplifier and 2 BPFs

A friend of mine has an ABE L60/TH, 60W p.s. UHF band (470 to 860 MHz)
amplifier, with a 3 cavity and a 6 cavity 500W tuneable filters also
supplied by ABE. All in mint condition. The part numbers are:

L60/TH/U/Ch 68 amplifier

L60/TH/U/Ch 68 STD I bandpass
L60/TH/U/Ch 68 STD I notch

The two filters are mounted on a 1U 19 inch rack mount, also mint.
He has asked me to sell them, any offers before they go on ebay?
Cheers,
Terry

You don't mention any adjustable components -- you _are_ tuning this thing, right? Your circuit will have a loaded Q of around 5, so you should see a pretty broad peak, but you will have to tune out all your stray capacitance.

Yes, but electronics follow a strange economy...some parts such as
batteries and pots haven't changed price much, but most are much
cheaper. You can now buy a`stereo FM receiver for $3.00 at Wal Mart.
In the sixties that would have cost at least $30.00. But today's
integrated radios have darn few parts that can be removed/reused.

Well, if it's any consolation, you will probably get lots more from the
handbook--in terms of weight, at least.

Also, you don't say what the input caoacitance is. In my modeling, with an assumption of about 4pf for chip and strays, the voltage gain is about 9 (19db), the resonance is a little below 400 mhz and you'd be about 10 db down at 434 mhz. I agree with Tim...tune it.

Source record: 10229

Yes, I tune the series capacitance of the tap(3-10p trimmer), the 5.6pF
is the calculated value.
The input capacitance of the IC is assumed to be around 2.6pF and I
allowed a couple of pF stray circuit capacitance.

As the match is so broad due to low Q, I would assume the tuning is not
critical and that any matching closer to the device input impedance
would show a significant improvement in sensitivity.

Does anyone know what the impedance of the SA605 is at 434 MHz?

Philips APP note AN1994 shows a table that states 1785 Ohms // 2.5 pF at
250 MHz and dropping to 588 Ohms // 2.75pF at 500 MHz. If I interpolate
the values between these points and assume the change is almost linear
then I would expect the impedance to be around 800R // 2p5 or 2.6.

I do not have a network analyser to determine the impedance.

Thanks

Regards

David

Well, we agree that we should keep this requirement, but I don't agree
that CW should seen as reflecting poorly on us hams. CW operation,
albeit old fashion, remains a useful skill that I think should be
encouraged. I do acknowledge that the new digital modes and computer
based CW does make CW skills less necessary, but I don't think we
should consider it old fashion or out of date.

Your 10 nanofarad capacitor as a bypass on the low RF input is ridiculous.
It has to have a self-resonance down in the low MHz., if not the kHz.

Use a bypass something on the order of 50 pf if a leaded capacitor, and
something like 200 pf if a chip.

Jim

Jim,

I replaced the ridiculously large 10n with 200pF as suggested. Not a gnat's wisker difference in the response. Should this have some noticeable difference ?

The Philips app note AN1993 shows a 152 MHz RF receiver using even larger and more ridiculous 100nF values for the RF decoupling throughout the circuit. Why would the IC manufacturer use these values ?

Regards

David

4733. RF data modules

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-03 14:07:54 UTC
From: SW <SW@!aol.com>
Message-ID: <26f76$45226eba$d871df4e$21265@PRIMUS.CA>
Source record: 10233

What are some RF modules that work well to transmit serial data from a computer to another device.
Will consider homebrew circuits.

Thanks

SW

Only if the low side RF input grounding makes a bit of difference in the performance. It seems as though this device is rather numb to doing anything with the other balanced input.

>
> The Philips app note AN1993 shows a 152 MHz RF receiver using even larger

Several reasons come to mind. The aforementioned numb unused input. They found some interesting motorboating (low frequency) proclivities and started throwing capacitors at it until they found the right value. The applications engineer was two weeks out of school on his first real RF circuit.

Jim

Many tnx to all- I did look up the patent. I really appreciate your efforts.
I ordered a 7B53A and will see if that is adequate. Jim.

Tony,

If I'm in a hurry, I order SMD's from Farnell.

For "planned" homebrews, I order SMD combo packs from Chinese E-Bay traders. You can find 5000 assorted and bagged resistors and 3000 ditto capacitors for less than £10 incl p&p. Look for "SMD resistors" on e-bay.

I even buy more expensive SMD'parts on E-bay and you can find real SMD bargains. Many SMD components have a "best before" date with less than a year solder warranty from the suppliers. It basically means that they doesn't guarantee the components if machine soldered. As an example, I bought 100 pcs of 33.333MHz SMD oscillators for 99 pence plus £2 p&p. That's less than 1 pence per oscillator! (plus p&p)

Guess why a lot of my designs currently are based around 33.333 MHz Epson oscillators...

Buying SMD oscillators on lower freqs are normally around £3 to £7 each.

Cheers

Dan / M0DFI

ROTFLMAO - I had to share this

I took a peek on Bay and the first interesting I ran across was from a British supplier (I'm in the U.S.) There was a link that stated that the translation was provided by eBay and might not be accurate. So I clicked on the link and read it in the original English! I'm not so sure what they translated since the word colour never appeared.

David,

What type of inductor are you using ? SMT can be sensitive with
proximity issues.

Are you 100% sure that capacitor values are as you hoped - SMT can be a
pain to verify.

Note, I did drop the 33pF to 15pF to improve return loss.

The 6.5pF cap is the most sensitive of all parts in the cct.

Any chance of a photo of the input network and signal coupling ?

My current bet is an inadvertently loaded wrong value component. Been
there, done that etc.

Regards,

Mark

2.3GHz is not too far from the frequency of a microwave oven.
Zap it and you will find out. It might be a good idea to
put a cup of water in the microwave with it.

Hi

I wouldn't try perspex nowadays
Perspex itself is very lossy when compared to modern compounds
I think perspex absorbs easily humidity and then you may have problems.
Specially in voltage maximum points of helical.
For the same reason I don't recommend fiberglass for outdoor use.

I recommend Teflon or nylon for insulators and supports.

I have read that toothbrush handles work very well. I'm not sure how you would use them to mount a helical antenna, but with it in front of you, it might be easier to figure out.

73,

Geoff.

Wow, I'm amazed you put Teflon and nylon in the same category! There
are many types of nylon, and AFAIK, none is particularly low loss.

One reference I have suggests a dissipation factor for polymethyl
methacrylate (unadulterated "Perspex") of about .008 at 3GHz. Nylon 66
(a common formulation) seems to be about three or four times that much.
But beware that you commonly don't get "pure" plastics.

For comparison, Teflon runs more like .00015 dissipation factor at
3GHz. Pure forms of polyethylene and polystyrene are similarly low.
Polypropylene tends to be good, below .001. Polycarbonate is decent at
around .002.

Cheers,
Tom

But be sure to pay attention to UV susceptibility if your antenna is exposed to the sun. Many plastics deteriorate quickly in sunlight, and polypropylene is particularly bad. And of course you might need to consider mechanical properties. Polystyrene is brittle and breaks quite easily. Polyethylene and Teflon are soft, and Teflon cold flows. (I don't know about polyethylene but suspect it might also.) Polycarbonate is tough and nice stuff mechanically, but don't know about its UV resistance.

I can speak to polycarbonate in a very small way: PCB ophthalmic lenses
are treated to provide excellent UV protection. But my understanding is
that pure PCB is not particularly UV resistant. Without a coating
(which provides the UV protection) it scratches very easily, so in that
sense, it is a soft material.

Polycarbonate sheets in many sizes are found in do-it-
yourself stores as window glass replacement. While
expensive, most of those brands are marked "sunlight
resistant."

Lowes, Home Depot, OSH all carry polycarbonate "window
replacement" pieces here in southern California.

Those materials are apparently coated for UV protection. I put some
in the windows of a playhouse I built for my granddaughter and the
protective film was labeled as to which side should be out.

A private auction doesn't limit who can bid on the item, it just hides the user ids of the people who are bidding on it. I bought an Icom PCR-100 from him a while ago, and while I am quite happy with it I noticed he had a few more for sale that where owned by the same guy with a 486 who was selling it because he didn't know how to use it. However, there was an issue that came up in the sale and he handled it very well.

4760. PSD on a spectrum analyzer.

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-05 15:36:21 UTC
From: "radiofreeq@gmail.com" <radiofreeq@gmail.com>

Source record: 10161

Hello,
I think what we read on a spectrum analyzer is dBm for the specified
range.

dBm/MHz is the PSD.

Lets say if the signal bandwidth is occupying 500Mhz (UWB) and has a
PSD of -30dBm, then what is my power in the entire channel?

(-30dBm)*500 = (1microW)*500 = 500 microWatts = -3dBm

So do I see the -3dBm signal level on the spectrum analyzer in the
whole bandwidth?

Please correct me if I am wrong.

Thanks.

A spectrum analyzer has filters with particular bandwidths. What you see displayed is the power passed by the filter. If you have the analyzer set for a 5kHz resolution bandwidth, what you see, then, is the power in (nominally) 5kHz of spectrum. To make things accurate, you need to understand the shape of the filter, as well. In addition, you can't necessarily use that number to find power spectral density in other than a gross sense unless you know that the power is distributed more or less evenly across that piece of spectrum. That is, if you use 5kHz resolution bandwidth and the signal has 99% of its power in a 1Hz segment within that 5kHz, the signal's actual power spectral density (at its center frequency) is much higher than the indicated power per 5kHz.

Many modern spectrum analyzers will display power spectral density directly for you, taking into account the filter shapes and such. Also, beware that resolution bandwidth and video bandwidth (on analyzers that have both) are not the same thing.

Cheers,
Tom

4762. GE paging transmitter 4CX250 question.

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-05 17:00:51 UTC
From: hexter@blazenet.net
Message-ID: <y6mdnQ6Jtbrep7jYnZ2dnUVZ_o2dnZ2d@suscom.com>
Source record: 10163

Hi folks,

I am responsible for the care and feeding of our GE pager transmitter on 150mhz vhf frequency range. I don't have the model number here as I am at home at the moment. It uses a single 4CX250 in the cavity final.

The problem is this, 10 watts output with 10 watts input, Plate voltage is 2100, plate current is very low at 100ma (normal is 270) and the screen voltage is around 60 to 80 volts.

The screen is supplied through an 80k resistor from the 2100 volt supply and has variable resistors to ground to set the actual screen operating point. I have placed as much as 500 volts on the screen circuit externally with the tube removed to check the bypass caps and they seem fine. They withstand the 500vdc without breaking down. The tube is good, we tried it in another cavity (our spare amplifier). The plate circuit is good also. At first I thought I had lost a plate choke or connection causing the screen to draw excess current.

I know the screen is drawing excess current causing the screen voltage to fall off. The control grid current looks normal and behaves normally with tuning controls. I don't get it?? How can I have excess screen current and yet have the low plate current? The tank circuit seems normal, the tuning controls appear to work properly, in fact every once in a while the unit will work perfect for a minute or two making 250 watts output, then it goes back to acting weird again.

Anyone ever have a GE vhf amplifier do this? Thanks!!

To add to what Tom wrote,

Ordinary spectrum analyzers sweep the filter across the band of interest, so what you see is not only the power in that filter bandwidth, but the power that's at each frequency at the moment the filter is there. Movement of the filter frequency constitutes modulation of the observed signal, which in itself creates sidebands. So what you see on a spectrum analyzer is heavily influenced by the relationship between the nature of the modulation causing the bandwidth spreading and the sweep rate of the analyzer. With some broadband signals, you can get vastly different displays by changing the resolution bandwidth and sweep rate, or with different filter shapes.

This is covered in detail in _Modern Spectrum Analyzer Theory and Applications_ by Morris Engelson (Artech House, 1984). I highly recommend it to anyone needing to measure and interpret complex waveforms on a spectrum analyzer.

Hi

Before you test perspex immerse the test piece in water for some days.
Maybe this simulates rainy days.

For very low noise frequencies, perhaps you could use a pseudo-random sequence generator made from fast logic clocked at say a hundred MHz, and calculate what the "noise" power spectral density in the output signal is. My only other suggestion is if you can make a 50 Ohm resistive terminator on the end a teflon cable that will go into an oven, then you can just measure the noise temperature directly... as long as you don't want an ENR over 3dB.

Chris

Does Engelson's idea of "modern" include digitizing spectrum analyzers, which have already taken over most of the mid- to high-end of test equipment and -- as with digital scopes -- will most likely soon be in all but the lowest of the low-end of instruments?

Thanks,

Hi,

If you connect the 80k Screen resistor to ground via an ammeter, how much current do you see ? I would expect 26mA.

Are you sure that there arn't any shunt regulators on the screen supply ? Zeners, or an active regulator ? I have never heard of screen to HT without a shunt regulator before...

Regards,

Mark

No, the book was written before those came about. I fudged a little by qualifying my posting with "conventional" spectrum analyzer to exclude newer technologies, but it sounds like "conventional" is rapidly advancing to become the newer types.

I got out of the SA development world just as digital techniques were beginning to develop -- my last patent (# 5,629,703), in fact, dealt with a way of reducing distortion in an A/D converter intended for use in a SA-like instrument. At that time, we were anticipating doing a conventional sweeping down-conversion, then digitizing it at a 25 MHz IF. Predictably, the digitization point has been moving toward the front of the instrument since then.

I haven't followed the technology since, but I'm sure the new ones use sampling techniques combined with an FFT, which is another way of imperfectly representing what the real spectrum is like. (Actually, you can never perfectly represent the spectrum of a real waveform, because any spectrum which is finite in frequency span has to have existed for an infinite time. Any modulated waveform is way outside this category.) Sampling produces its own, different, sorts of artifacts which are different from the ones produced by sweeping, although there are some similarities. You have to be at least as careful, and maybe more so, in interpreting a sampled waveform as one which is from a swept filter.

I'd be surprised if someone hasn't written an equivalent book to cover the new type instruments, although a lot of the material in Morris' books is still valid and teaches a lot about the nature of spectra. Morris was the driving force behind Tektronix's entry into the spectrum analyzer market, and the group's chief engineer and architect for a long time. He'd retired by the time I joined the group, and I only met him when he taught a couple of one-week courses based on his books. He's truly one of the experts in the field.

I personally love my FT-857. Mine is the original model, not the "D" model, but I modified it for full transmit (I use it with transverters I build to get on other bands...right now I have transverters for 222 and 902) so it should work on the newer 60M band but I haven't tried it there.

It is a very small rig with pretty big features! When I ordered mine, they threw in the DSP board. I've never had a rig with DSP, but it sure does work nice!

I don't think you'd do much better for an all around rig (starter or advanced) for the money! Hopefully, others will chime in here as well.

You didn't mention what license class you have, but the rig would be great for any class. It has 100 Watts out on HF and 6M, 50W on 2M and 20W on 430. My only wish is that they would have built 222 in as well, but I built a really simple transverter for 222 (designed by W1GHZ... http://www.w1ghz.org)...I use mine at home, portable and mobile. No problems and I've had it for about 3 years now.

Happy hammin' !!!

I really like my FT-857, and would buy another to put in the other car if
I had the cash to spare. Be sure to buy the separation kit and put the
control panel where you can see it without having to divert your eyes from
the road, and give *serious* thought to the fancy handmike with all the
controls on it except Squelch.

The 857's big brother, the FT-857, makes a good shack rig, too, and the two
radios use the same programming software, so that you can have the same
memory settings on both.

The 857 has a nice, sensitive receiver, and I've worked Italy, Germany,
Hong Kong and Taiwan mobile from central Oklahoma. It should really shine
when the sunspot cycle gets a bit farther away from the minimum.

But it's not really homebrew.

Anyone got pointers to a good *and* inexpensive 2m FM foxhunting xmtr with integrated controller? Ramsey used to make just exactly what I want, and so (of course) they've discontinued it.

I'd like it to do a (programmable) CW ID, with a programmable delay from a minute or so up to 30 minutes, in roughly 1-minute steps. Xtal control is OK, but a good, stable VFO (DDS or DDS + PLL, rather than PLL alone) would be better. Settable power level would be good, too, and I can do with max power about 1 W.

Thanks and 73, de

In absence of dedicated controller, you could use one of the memory keyers, AEA comes to mind. They have beacon mode, where you can program message and set the repetition time.

Thanks, Yuri. If nothing else comes up, I may go to that, or roll my
own.

I'm looking for something that doesn't involve using an HT. I'd lots
rather use the HT on the fox hunt, and not risk having it stolen.
Losing a transmitter/controller would chap me considerably, but losing
my HT would be _bad_.

If I wind up doing the full-tilt-boogie 5-transmitter foxhunt, I'd
really prefer not to buy 4 more HTs, for that matter. 5 ammo cans,
each with a transmitter/controller and a battery inside and a BNC or
SMA jack through the lid, would be a lot more affordable.

I would think you could get *used* HTs pretty cheap.

For that service, you don't need fancy scanning features etc. --
something like an old IC-2AT would do fine - and since you're going to
need to power the keyer anyway you don't really need a workable battery
with the HT.

I would think you could find something useful for less than the cost of
a new transmitter kit or the parts to build one.

You can use ferrit antenna rods. That works for receivers very fine in VLF band and for transmitters too - as long as the ferrit won't go into saturation.
That is a magnetic antenna and it is much shorter than the equivalent mentioned.

- Henry

I would say that the screen current is high because the plate voltage is swinging down too far (i.e. there is little or no loading on the tank circuit or it has become mis-tuned). One possibility, if it has one, is an open plate blocking capacitor.

BTW, the screen current on that series of tubes is often used as a tuning aid; some metering circuits even having a negative screen current position for when the grid gets too hot and emits electrons.

Do a web search for the "Montreal Fox". I've built one that works OK.
The circuit board that's available is quite rough, but the thing is
buildable.

Ferrite rod antennas with perhaps -50 to -60 dB gain are useful since the extremely high band noise at VLF. It does not matter very much if both the wanted signal and the band noise is attenuated by 60 dB, as long as the wanted signal at the antenna terminals is stronger than the preamplifier thermal noise.

For transmitting, such antenna would be ridiculous.

In order to get 1 W EiRP as allowed on the 135 kHz amateur band in many countries, you would have to feed 1 MW into an antenna with -60 dB gain. The ferrite rod would saturate at much lower power levels such as 1 W or a few mW. Most likely you might get a few nW radiated power without saturating the rod.

Indeed, we've been making spectral analysis equipment using FFT techniques since the early 80's or even a little longer. I believe the HP3577 from that era uses digital IF techniques, though I never got familiar with its "guts." Things have come a very long way since then. Just as Roy says, there's a whole different set of things to understand to get accurate, meaningful measurements out of them. Even knowing what I do, I still get surprised by the instrument's response to particular signals sometimes.

With respect to signals in finite bandwidths having to have existed forever, in theory that's true, but in practice, noise from sources beyond the signal of interest will always overwhelm those portions of the signal that are very far from its main power, for a huge proportion of practical signals. We'll keep pushing for higher spurious-free dynamic range and lower noise floors in the instruments, but it's probably fair to say they'll never be perfect, and signals are essentially always polluted by external noise sources as well, if only thermal noise in external resistances.

I believe you can find some information on the Agilent website about factors to consider when making FFT-based spectral measurements. I probably have a pdf or two hiding somewhere in my archives covering some of this, too.

Modern analyzers are backed up by some very impressive software that can help you analyze all sorts of things about modulation, signal variation with time, etc. It goes FAR beyond simple spectral displays of FFT results.

One of the key features of FFT-based spectral analysis is that you don't miss as much as a swept analyzer with narrow IF does. For example, if you have a signal that keys on for a millisecond out of every second or so at 100MHz, it might indeed be radiating a broad spectrum but there's observable energy only within a few kilohertz of 100MHz. An analyzer sweeping 50-150MHz with a 1kHz resolution bandwidth will take quite a while to do its sweep, several seconds, and may very well not be "looking at" 100Mhz, or close enough to it, at the time the pulsed signal comes up to be able to see it. But an FFT-based analyzer that's sampling fast enough to capture the whole 50-150MHz band at once can easily find the 100MHz signal every time it pulses on. The FFT is, quite literally, a large bank of parallel filters/energy detectors at evenly spaced frequencies. In combination with a "windowing" function, the effective shape of those filters can be adjusted.

Cheers,
Tom

Was Dennis Rosenauer around while you were still at Tek? Last I heard (a couple of years ago), he was working on their spectrum analyzers. As you're probably aware, Tek pretty much dumped spectrum analyzer development for awhile in the '90s, and something like 3-4 years ago hired Elaine May to be the new product group manager... she having been layed off when *Agilent* decided to dump *their* spectrum analyzer development! Sheesh. Rumor had it she was trying to get a a bunch of her former co-workers from Agilent to join her up at Tek.

These days Tek and Agilent seem to have realized that SAs are rather important, albeit with Agilent pursuing a more "traditional" architecture (very high frequencies, mix down to IF, digitize there) but Tektronix utilizing their high-speed ADCs from their scopes to just digitize directly and compute FFTs -- this approach limiting them to lower frequencies with noticeably less dynamic range, but giving them the advantage of being able to trigger on arbitrary masks withoug ever "missing" one.

...

Sheesh, indeed. Where did you hear _that_? Lots of shrinking happened back then (and not just in Agilent, for sure), but it would certainly be a stretch to say that they "dumped their spectrum analyzer development." That's a pretty gross misrepresentation of what went on.

Cheers,
Tom

I have an idea. This should thin the ranks of amateurs and let Big Brother have the bands as is desired. We all know the FCC wants to sell the bands to the highest bidder. In addition to the code requirement, lets have proficiency testing in SSB, FM, RTTY, PSK-31 and Packet. That should just about kill the code proponents off, as they are mostly too old, addled, and unable to learn. That way, even they won't be able to use *their* bands without these proficiencies.

Sounds like a plan, eh?

And just who do you think developed these modes? How new do you think these
modes are? It seems like everyone I contact on the "new" mode of PSK31 is
retired and has been for many years.

sample check Dee: how many people that you contact on ANY mode are not
retired and have been for years

went to our Radio meeting tues night and a talk was given on the "New"
mode PSK-31

if your sample is skewed towrd retirees as badly as mine........

4791. Check the SWR on your HF antenna's.

Then make a couple CW contacts this weekend.

You'll get up from your rig afterwards and feel pretty good about being a ham again.

I could go for that.

The more testing, the better. Then outsiders would look at the amateur
radio service and see valuable and capable operators, they would see our
spectrum wasn't being wasted by people that only know how to talk into a
microphone to communicate.

Thanks. :-) Great idea.

wrote:

>Sure Paul. It is as a transmitting antenna for short-range only.

So we are talking about a near field system.

In the far field the ratio between the electric (E) and magnetic (H)
field is constant and is 120 pi or 377 ohms. This field is inversely
proportional to the square of distance since both the electric and
magnetic field is inversely proportional to the distance.

However, very close to the transmitting antenna (near field) the E/H
ratio is no longer 377 ohms. The magnetic field is inversely
proportional to the square of distance and the electric field
inversely proportional to the cube of distance.

There is much debate were the near field ends and were the far field
begins. For simple antennas, the distance is less than one wavelength,
the value lambda / (2*pi) often appears in literature. For large
parabolic reflectors or lasers, the far field begins at hundreds or
thousands of wavelengths.

Near field communication systems have been used for decades e.g. in
induction loop systems for the hearing impaired, in which a magnetic
loop is surrounding the room and audio frequencies are fed into the
loop. The headset will pick up the field, amplify the signal and feed
it to the ear of the person with reduced hearing. Of course, such
systems are now more or less useless due to the stray magnetic fields
caused by various inverters.

>Do you know
>about:
>http://www.ancom.no/
>products? They claim their ferrite rod styled antenna works as good
>transmitter. See their patent application.

These seem to be near field devices even at MF, where they seem to
operate.

Top posting is a sign of inexperience. You are probably a newbie on the net. Go to news.groups and read the FAQ on Usenet etiquette first. After that, come back here and post properly and I will give you my call.

Actually top posting is a sign of *experience*. Us guys that were on the internet back when it was run by darpa always top posted. That was because we were running very slow lines, typically 110 to 300 baud, and it was desirable not to have to wait through the down load of a dozen copies of the same quoted material as we progressed through a thread. Bottom posting forced everyone on the newsgroup to fully download every article waisting tons of our very limited bandwidth and time. Top posting allowed you to get right to the meat of the article in the first few seconds of downloading... and it allowed you the option of continuing to footnotes if you really needed to.

You newbies have dozens of ways of trying to impose your will on the group. Most of your so called rules of etiquette are simply you following the bottom posting convention that was set up as a default on internet explorer. Rn, trn, tin, and other premicrosloth news readers defaulted to top posting.

You are so spoiled by high bandwidth and large amounts of memory that you think that a posting arrives at your machine in its full length instantly.. and for all practical purposes, it does.

I can go either way. I do, however, get very tired of having to scroll through the same old quoted crap at the top of post after post... just to get to the bottom and find the highly informative, but typical, "me too" tacked onto the end.

Bzzzzzzzzzzzzzzzzzzzzzzzzzt!

My bullshit detector just went off real loud. Here is an authoritative
statement about ARPANET from one of Comer's books:

"Initially, most of the leased data circuits in the ARPANET operated
at 56 Kbps, a speed considered extremely fast in 1968 but slow by
current standards." -- Douglas E. Comer, Internetworking with TCP/IP,
Volume One, 3rd Edition, Prentice-Hall (1995), page 57.

300 baud, my ass! You should have been on a time sharing machine
connected directly to the 56K ARPANET, so don't bother to backpedal by
claiming dialup speeds. (And of course Usenet didn't even begin until
the 80's, shortly after ARPANET had ended.)

Don't try to bullshit someone who has forgotten more about the subject
than you have yet to learn.

Yep, those were the *backbones* of ARPANET. We had *ONE* at the University
of Maryland back in the 1970s. That leased line cost thousands of dollars
per month, and was paid for by darpa. Compare that to the backbones of today
which are measured in terrabits per second. These 56K backbones were
connected to mainframe computers that acted as concentrators, and provided
connections to other mainframes, and to thousands of users on timesharing
systems. Yes, I have that right, *thousands* of users shared a single 56K
backbone.

Those users that were local to the concentrator (eg, in the computer room)
were connected to the mainframe by various speed RS-232 lines, but those who
were on remote dial up connections were connected by good old bell 103,
110 to 300 baud modems.

> 300 baud, my ass! You should have been on a time sharing machine
> connected directly to the 56K ARPANET,

Yep, we were on timesharing machines, Univac 1106's, 1108's, and 1140's,
and as I said, thousands of users shared a single 56K leased line into
Darpanet. Do the math, if you can't, I'll help you:

56K/1000 = 56 bps.

If there were *only* 1000 users vying for the net at the same time, they
could each pump 56bps into the backbone. But there were many many more
than that, and they weren't always needing the net all of the time.

(hence the name concentrator)

so don't bother to backpedal by

I'm sorry, I don't backpedal for idiots. I don't brake for them either.

> claiming dialup speeds. (And of course Usenet didn't even begin until

Riiiight! Just because you can look up darpa on a wiki somewhere, doesn't
mean you can understand what you have read.

So you think that 1000 users at your location were always using
ARPANET simultaneously? Please don't tell me that someone gave you an
engineering degree, because you obviously didn't understand the course
work.

Comer's books on TCP/IP are standards, and they don't involve a wiki.
They happen to be in my library of reference textbooks, and they
happen to be standard references kept in all university libraries.

The claim about slow speeds on ARPANET and Usenet is quite stupid.
ARPANET and Usenet did not exist at the same time. ARPANET didn't use
TCP/IP protocol, and it gave way to what is now called the Internet
when TCP/IP became the standard packet delivery protocol. Shortly
after that, the message posting system called Usenet was formalized to
run on the Internet and on several other message delivery systems
(such as UUCP). So your reference to ARPANET is simply irrelevant.
ARPANET and Usenet never coexisted, making the claims about 300 bps
and other speed limitations total BS intended to impress the ignorant.

Enough said. Conversation ended. You don't seem to be worth any
followup messages until you do some additional reading.

Anybody ever tried connecting both sections of the valve together and using this device on HF instead of VHF? Its cheap and is good for 100W max output with 1kV anode potential.

Heh heh heh...the "high tech" of its time, a mere 30+ years
ago. "Speedy" Teletype Model 33s (?) and "high speed" 300
baud video terminals (with local memory to print out screens

on Teletypes) where I was using it. :-)

>> 300 baud, my ass! You should have been on a time sharing machine

"Concentrators" still exist but in a vastly different form,
configuration, and specifications. As a personal computer
hobbyist since '76 I've not delved into them (no need to for
personal dial-up connections) but know many who are; they
have supplied some interesting literature on them as well as
in-person explanations.

>> so don't bother to backpedal by

SolderSmoke!
A SHOW FOR ELECTRONICS HOMEBREWERS!

http://www.soldersmoke.com

Listen at: http://www.soldersmoke.com

SolderSmoke #34 (October 7, 2006) is now available
on http://www.soldersmoke.com

Ashhar Farhan joined us from India for #34:

-- BITX-20 transceiver.
-- HB in India.
-- EMRFD.
-- W7ZOI influence.
-- Hans Summers.
-- Quadrature rigs.
-- DSB and PSK31.
-- Homebrew test gear.
-- The importance of measurement
-- Farhan's 'scope.
-- Homebrew heartaches.
-- Homebrew spirit.
-- Symmetry.

Tired of listening to Led Zepplin or NPR on your
I-Pod? Wouldn't you like to be able to carry with
you the kinds of ham radio conversations that you
listen to while in your radio shack?
Mike, KL7R, in Juneau, Alaska, and Bill, M0HBR, in
London, England meet regularly on the ECHOLINK system
to discuss their homebrew radio projects. We are
making them available as PODCASTS.

RSS FEED: You can subscribe to the program, have
them downloaded to your MP-3 player, and listen to
them at your convenience. To subscribe, just cut and
paste this URL into your I-poder (or similar)
software.
http://www.soldersmoke.com/soldersmoke.rss

If you don't have an MP3 player you can just go to the
site below and listen to the latest program (and
earlier editions) using the audio software on your

computer.

http://www.soldersmoke.com

All our programs are available here.

We hope you enjoy the program. Please send us feedback.

Not a good idea. This dual tetrode is internally neutralized for
push-pull operation (the little crossover "twigs" above the anodes) but
in a parallel connection that same capacitance will appear as unwanted
anode-grid feedback.

> Its cheap and is good for 100W
>max output with 1kV anode potential.
>
The QQV06-40A is not capable of a clean 100W output on SSB! Many have
tried over the years, and all have either failed or become extremely
unpopular on the air.

If you want higher power at low cost, go for a GI-7B triode.

For a quickie CB antenna, a vertical dipole (1/2) wave can be made right from the coax itself You take your coax and very carefully, without nicking the braided shield, strip 102 inches of the outer insulation jacket off one end. After removing the outer jacket, start bunching the shield down the coax from the end. Now, where the outer jacket and the shield meet, separate the braided shield enough to get the inner conductor out through the hole in the braid. Pull all of the inner conductor through and stretch it and the braid out. Be careful not to skin any of the insulation off the inner conductor. Now attach an antenna insulator to the end of the inner conductor. Measure the braided shield. Cut it off at about 106" and attach an antenna insulator to the end. The total length of the inner and outer conductor should be about 17 feet (1/2 wave). You can haul it up to any height you want with a string or rope attached to the insulator on the center conductor. It's a good idea to coat the end of the coax cable where it separates with some kind of waterproof sealer. This keeps water from seeping into the coax, which could cause a high SWR.

Just attach a coax connector on the end of the coax going to your transceiver and you are on the air. The SWR should be 1.5 or better, if cut to the proper length. It'll get out about as good as a ¼ wave ground plane CB radio antenna if you get it up high and in the clear. Do not hoist this antenna up next to a metal pole, because the metal will interfere with the antenna's operation and cause a high SWR

just get the lenght's right and you can mount this to a NON conducting pole eg wood , plastic coated carbon(fishing pole)

Just because you can find the names of some books by using google, doesn't mean you have ever read them, or understood them. I have copies of all three volumes of "Internetworking with TCP/IP- Client -Server Programming and Applications" by Douglas E. Comer, and David L. Stevens, Prentice Hall on my book shelf. (pick a page, any page, and I'll give you a quotation from it.)

If you note the copyright date of this series, you will see 1993. A mere 20 years after I started working with GE's world wide networks... top posting my email on model 33 teletypes with bell 103 modems.

>
> The claim about slow speeds on ARPANET and Usenet is quite stupid.

Really? Well, I suppose you think that everyone had 56K connections back in the '70's. I worked in the Electrical Engineering department at the University of Maryland, back then, and we were pretty proud of our first 9600 baud connection between the PDP11's, and the Univac's that had the darpa connection. It wasn't until we got a VAX 11/780 that we got a 56K pipe to the Univac's that connected to the darpanet. That was around 1980. I think diapers were you most prominent media for communication back then.

> ARPANET and Usenet did not exist at the same time. ARPANET didn't use
> TCP/IP protocol, and it gave way to what is now called the Internet
> when TCP/IP became the standard packet delivery protocol.

Prior to usenet, a variation on email, we were using email broadcast lists. The same top posting rules applied.

Usenet came into being while I was in graduate school, around 1980-83. I remember there was quite a buzz at that time. Decwriters were 300 baud, and the most common affortable modems were still using the Bell 103 standard

from the late '50s. 1200 baud modems were used for expensive applications,
usually computer to computer data transfer. The 1200 baud modem didn't come
into general use until DC Hayes produced an inexpensive model around 1983.
It was a real screamer compared to the Bell 103's.

Shortly

>
> Enough said. Conversation ended. You don't seem to be worth any
> followup messages until you do some additional reading.

I don't need to read about it, I was there doing it. My first
exposure to a world wide network was GE's back around 1970. It was the
first commercial use of a global network. The normal terminal to connect
to that net was a Model 33 Teletype, with a bell 103 modem. I bet you
think they used Windows based PC's with 56K modems, and Netscape.

Thanks Paul for the long explanation!

I don't found a good source how ferrite rods works for transmitters. All say it cannot work because of big power eating in the ferrite. How much power is possible?
I think 1 watt should be possible.
I google on...

> >http://www.ancom.no/
> >products? They claim their ferrite rod styled antenna works as good
> >transmitter. See their patent application.
>
> These seem to be near field devices even at MF, where they seem to
> operate.
No! They are far-field devices.

I even saw a explosion picture of a mobile phone antenna 900MHz helix construction as composite in a (ferrite?) filled outline.

Does an antenna exists, which receives BOTH field-vectors? If the antenna covers only one /E or M), half of the transmitting power is lost - correct?

- Henry

Hello John. I'm KB9RQZ, and I just love CW. We need to bring back code
testing for Techs. 13 wpm should work fine, Then we can keep the
riff-raff off the repeaters and end all the bogus moon bounce contacts.

I've been burned by bogus EME contacts, but I'm a retard.

Hey Mark, this retard is following you around and harrassing you. You
should complain his ISP about him and dont let the bitchwhore get
way with it. He also violate his state laws and you state laws and
you can file police complaint against the harrassment coward.

Hi Tom,

"K7ITM" <k7itm@msn.com> wrote in message
news:1160168316.507130.68170@m7g2000cwm.googlegroups.com...
> Sheesh, indeed. Where did you hear _that_?

Various people at Tektronix. Perhaps they were trying to portray Agilent as being somewhat more "shrunken" than they really were based on how downsized they'd just been?

The new Agilent MXA series analyzers look really nice (we've had a demo). I'm glad to see that the Agilent spectrum analyzer folks realized that, if you're going to have an instrument that's based on a PC architecture, people want a *good* PC architecture to back it with -- I'm thinking of the MXA's XGA LCD, some reasonably modern CPU, etc.; it's *snappy*. Compare to some of Agilent's network analyzers... we have an N5230A that's only 9 months old, and it has a 640x480 LCD *with a dead pixel* and a whopping 500MHz CPU. Ouch! My understanding is that the current ones still have the same old LCD, but a 1.1GHz CPU now (woo hoo!)

Thanks for the extra information,
---Joel

All the crotchety old farts are either off somewhere beep-beep-beeping
away on CW or bitching to each other on the lower half of the 80m phone
band, so it's easy to avoid them and talk to someone who enjoys ham
radio as it is instead of whining about how it was.

4859. Stop Bio-TERROR in America: The Government of Torture!

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-10 19:15:03 UTC
From: poetry4justice@yahoo.com
Message-ID: <1160507703.434461.142800@k70g2000cwa.googlegroups.com>
Source record: 10109

AMERICA IN DANGER of its own out-of-control Bio-Terror:
Is 1984 here? Or cripping... God help us,
blinded!
Originally Secret Bio-Aerosols are misused to HARM and Torture in
U.S.A.
Tempering with pills/ medicine/ treatments to HARM and DISABLE !

Our government needs TORTURE in U.S.? See details
below...
It has your VOTE, support? Abused... for power-grab or
vicy-terror!
Transitory harm and HELL are U.S.-legal? for
critics-cleansing.

Did Denny Hastert cover the basterd? And other Washington
crooks?

CRITICS (political/social/cultural) are harassed and secretly
persecuted
along with their KIDS in schools/colleges, especially, during
tests/exams
(Think: Guantanamo "stress-positions" in the context of
1984-technologies)
Female FBI-informers are coerced
and abused!

Bio-Aerosols and aerosolized chemicals are used to cause:
- severe colds/coughs turning into bronchitis, eye irritation
- bacterial pneumonia/other pneumonia, shortness of breath
- surges of severe headaches, migraines, dizziness, etc.
- fainting collapses by symptoms-mimicking aerosols
- severe stomach pains (sharp, burning, nausea, etc)
- chest-wall pains, heart-muscle inflammations/trauma, etc.
WORSE:
- heart attacks under cover of second-hand smocking
- aerosolized chemicals from the death-penalty drugs
- car crashes/accidents by Vertigo-causing aerosols
- car accidents due to the fine/controlled tempering
- liver/organ failure by small-dose toxins (trace-less?)
- cancer-causing/facilitating - months-long assasinations
This "Yushchenko syndrom" CAN destabilize NATIONs
Waste, Fraud, Cronism and Abuse in HomeSec/FBI
Fabrication of Believable Info/Manufacturing of accidents

U.S. mail IS polluted in "anthrax-like" manner to HARM critics
Libraries, airplanes, hotels, offices, buses, trains - all polluted!

Remote control, off-jacket/off-book/off-paper pollutant attacks!

A network of Secret Gas-Aerosol Rooms operated in US
(in Philadelphia, Narberth, Lower Merion, PA)
(in Wilmington and Newark, DE)
(in Hampton, Williamsburg and Richmond, VA)
AND ELSEWHERE.... details below...
Freddie May/Freddie Mac likely used to buy silent cooperation
Bio-aerosols used to hurt and simulate panic attacks, etc.!
Soviets locked critics into nut-houses, now WE do the same!
Symptoms-mimicking aerosols do HARM, weak or ill people.

Echo-location/wire-taps/listening used to turn homes into cages!

Say "Stop, I care" - call Senate (202) 224-3121
House of Representatives (202) 225-3121
What IS going on in America? *Print and
Post*
Manufacturing of FEAR to grab more Power and Money, of course.
Tragedy IS used to Power Graib, while Fear is molded into profit!

Big Brother spins protection...
And fear is used to clamp.
Democracy needs action!
On which side do you stand?

Looked at this?!! Go to Google/Yahoo newsGroups:

TORTURE IN USA: Secret Aerosol Rooms

US Scientist needs legal help dealing with the secret aerosols rooms
(SARs) operated illegally in Philadelphia area, Newark (DE), Hampton
and Williamsburg (VA) and other places. Highly volatile aerosols with
and without bacterial content cause dry cough, airways a...

Full text was at:
http://buyit.philly.com/findit/search/results.jsp?catId=krd_philenqda...

This was a new on-line ad placed in Philadelphia Inquirer and
Philadelphia Daily News on www.philly.com (see full text below)
It was about the secret aerosols rooms in US. One could find it by
searching "secret", say, in the ad section of philly.com.

Democracy can not function effectively without the informed public. As
a former NASA Langley scientist working in the area of nanotechnology
and nanoscale particles, I have been recently exposed to the
establishment of secret gas-aerosol rooms inside of United States, at
least in the Mid-Atlantic region (from Philadelphia to Virginia).
First, the highly irritant aerosols have surfaced at the NASA Langley
Research Center in several safety accidents. Investigations were
blocked, probably, because of lack of Congressional approval for such
financially-lucrative research at NASA. Later, these aerosols had been

encountered outside of NASA in Virginia, Delaware and Pennsylvania
.
This points out to yet another proliferation of originally-sensitive technologies into domestic American life to hurt and harass people without a proper oversight and much control. This amounts to torture, extra-judicial prosecution and authoritarian intimidation tactics. The use of such irritants and the operations of the secret gas-aerosol rooms are gross violations of human and constitutional rights of American citizens and various domestic and international laws.

------------------Full text of an ad from Philadelphia's philly.com--------------------------
TORTURE IN USA: Secret Aerosol Rooms
US Scientist needs legal help dealing with the secret aerosols rooms (SARs) operated illegally in Philadelphia area, Newark (DE), Hampton and Williamsburg (VA). Highly volatile aerosols with and without bacterial content cause dry cough, airways and eyes irritation, chest pain and inflammation. FBI and Homeland Security associates are likely operators of SARs, while collaborators may be hotel staff and landlords, who get financial/material or other incentives. US citizens and kids are victims.

Torture is any act by which severe pain, whether physical or psychological, is intentionally inflicted on a person as a means of intimidation, deterrence, revenge, punishment, sadism, or information gathering. At times, medicine and medical practitioners have been drawn into the ranks of torturers, either to judge what victims can endure, to apply treatments which will enhance torture, or as torturers in their own right. http://en.wikipedia.org/wiki/Torture

America in Danger!

America in danger -
The vice is NOT impeached.
America in danger -
The public trust is breached.

Big Brother spins protection
And fear is used to clamp.
Democracy needs action!
On which side do you stand?

Which side are you on, boys?
Which side moves you on?
Which side are you on, girls?
Which side did you wrong?
(Chorus after F. Reece)

Your church is burned by haters.
The priests to go to jail?
Your dreams are cheyned by traitors,

But hope still shines through veil.

Dust rooms came back to gas us
With neo-Naz (or Con) embrace...
New immigrants do make US!
And not the SSuper-race...

***

The Government of Torture

Our government needs TORTURE?!
It has your VOTE, and, now, support?
But peace (not vice) needs steady nurture
And trustful words of calm rapport.

Beware of loud, but FALSE, ideas
That flame a thirsty hellish torch.
Protect the old and true ideals
And Constitution's civic urge.

Yes, torture IS a hellish torch -
In bloody hands, a blinded sword,
With Constitution used to forge
All laws on rights as mere absurd!

Remember victim's silent cry
And SEE the Christ in all of us.
Don't let your government to spy
And torture with some bio-dust.

There is NO good use for evil torture!
No matter how the need is spinned
By Nixon's men, as bloody sergeants,
While truth is painfully re-skinned.

I am wondering what's the bad effect of cascading a lot of low noise amplifiers? It seems that if I devide 90dB into 4 LNAs I will have much less noise figure. Can I use 5 LNAs in series? Any disadvantage about this way? Thanks.

If your 1st LNA has the lowest noise figure and sufficient gain, it will set
the noise floor.
You can work the cascaded amplifier equations and see what you will need.
90dB seems like a LOT of front end gain- unless this is very narrow band, I
would be very concerned about overload resulting in all kinds of in band
garbage.

Source record: 10121

What do you mean by overload? How come there is too much garbage as
long as my NF is low?

I actually need 143dB gain. What kind of problem I will have if I just
use 6 stages of amplifiers, like 1stage(20dB, NF2.4dB) 2nd stage(30dB,
NF3db), 3rd stage(43dB, NF 6.2dB), 4th stage(43dB NF6.2dB). It seems my
NFtotal is pretty low. What's my problem?

Thanks.

Your problem is you don't know what you're doing.

What frequency is this oscillator going to run at?

I asked what I don't know. I am expecting a helpful answer.

The frequency is 70MHz.

Basically, with 20 dB of gain, your noise figure will be well established with the NF of that first stage of 2.4 dB. It will actually deteriorate a tenth of a
dB or so for the further stages down the line, but not very much. The second stage could have as great a noise figure as 10 dB and the total would only deteriorate to 2.62 dB

If you need additional gain, it's best obtained after some selectivity. 140 plus dB of gain on a single frequency is going to be VERY difficult to tame and keep from oscillation in it's own right.

It seems that I know the Friis equation.

I am asking because it seems difficult, and maybe impossible. I've never heard of this high gain before, but I dont' know why I cann't stack amplifiers and I am looking for somebody who can tell me what exactly the problem is: you see the NF is nice, and I can get the SNR if the band is narrow enough.

It also seems that I "don't know what I'm doing". So please explain a little if you want me to understand. Thanks.

It sounds like you run a lot of 11m, not surprising considering how much
you whine, and it's not alternator whine.

Well, how about a little additional information? What is it that you're trying to accomplish? A gain of 140 dB would amplify a signal of strength 8 x 10^-10 Watts (About the equivalent of a received signal of 10 dB over "S"-9) to a kiloWatt. I don't think you're trying to do that, so what convinces you that you NEED 140 dB of gain?

Regards

I'm dealing with a DSSS current signal at 70MHz. Before I start
designing anything, I am calculating the signal amplitude. It's going
to be 5nArms. If I have a 50ohm resistor, it's -153dBm. I'd be happy to
know any solid proof that it's not doable because it's my job now.

In theory DSSS signal can work under noise level, but can it be so
much?

I googled and saw GPS signal is -150dBm. So it's detectable, but it's
much higher frequency. What if it's 70Mhz?

Well, I have no idea of what a DSSS signal is, so I can't be of much help. Whatever it is, it better be in a very narrow bandwidth. At that signal level, it will take a 50 Hz bandwidth to achieve minimum discernable signal (MDS) with a front end NF of 2.4 dB.

If you're talking about using autocorrelation to bring it up out of the noise, all bets are off depending on how much time you can sacrifice.

If you're planning on bringing this signal to -10 dBm, better prepare for a lot of shielding and decoupling, not to mention filtering and frequency stability at 70 MHz center frequency.

Well, the GPS signal is detected all right, but they sure don't put all
their gain at the signal frequency.

It probably isn't going to make a lot of difference whether it's 25 cm. or
40 cm; the principles are the same for DSSS decoding.

GPS signals make heavy use of PN sequences so that they can be detected
using autocorrelation techniques. They're down below the terrestrial noise
threshold, and require autocorrelation techniques for synchronization and
detection. But you probably know that already. This probably will be true
of your solution as well, and especially so at those power levels.

If you're going to be receiving and detecting signals at those power levels, you'll need to use something other than *just* amplification to pull the modulation out.

One presumes you'll have a known short spreading sequence that you can use to try to sync up on the signal, or (if it's a longer sequence) that you'll have a rough idea of the code epoch, so that you can try to sneak up on it from behind, as it were.

The point here is that a _lot_ of the process gain comes from the autocorrelation and despreading processes. You may not need all that analog gain. Getting it up to ... something like -30 dBm or -15 dBm may be enough -- or even overkill.

Some comments:

DSSS is direct sequence spread spectrum. It is wideband on the front
end.

It is probably not a valid comparison to compare DSSS detection levels
with GPS. GPS encodes much redundancy into the signal to enhance S/N,
and unless the DSSS encoder does something similar we can't use the
same detection level numbers. To say DSSS works under the noise level
assumes some gain due to encoding, and probably also assumes an
information bandwidth much less than the spread spectrum bandwidth.

Here are the main reasons you can't cascade a lot of gain at the
operating frequency. Others have mentioned this--so this is just a
summary with clarification:

1. Stability. A lot of gain at a single frequency is difficult to do
without causing stability problems. Even careful shielding between
stages doesn't`always work. At 70 Mhz, about 40 dB is the best I can
do reliably and even then I would use two separate metal enclosures,
each with 20 dB of gain. Above, say, 60 dB all kinds of things go

wrong--enclosures don't shield well enough, power supplies don't decouple enough, interconnects talk to each other, etc. With single-chip MMICs and LNAs it's really easy to build something and see for yourself.

2. Intermodulation and blocking. Any unwanted signal at the antenna would be amplified--assume you are trying to detect a -150 dBm signal and someone in the house has a wireless headphone, which transmits at about 72 MHz. With 140 dB of gain your amplifiers would saturate completely and pass none of the wanted signal.

Radio design uses a careful balance between gain, mixing, AGC and filtering to minimize stability and overload problems. For narrowband signals you want to apply selectivity as soon in the signal train as you can. For spread spectrum you do the same: a filter as narrow as you can get it and still pass the spectrum, then your despreader at the lowest level you can make it, then a narrow band filter that just passes the information, and finally more gain and the detector.

3. Components
Some components such as crystal filters and mixers work better at lower signal levels before a lot of gain is applied. This is really just an extension of reason 2.

Hope this helps.

Well, I may have to go back to the old question, because it's not
exactly a DSSS depending on cross correlation. What are the possible
bad effects when I keep connecting amplifiers? Shorter bandwidth?
Smaller IP3? There should be something I don't know.

KT for any resistor at room temperature =-174 dBm/Hz. That's as good as you
get without cryogenic cooling.

Add 17 dBm to increase bandwidth from 1 Hz to 50 Hz = -157 dBM/Hz

Add 3 more to get to MDS and it's -154 dBm, your signal level.

While you are being all holier than thou, what did you design and build for your main rig? I'm hoping to be impressed, but expecting to be disappointed.

Did the code help you with the design?

I took my Advanced class test down at 1919 M street 36 years ago. I had to sit at the desk and copy one solid minute out of five error free at 13WPM. I passed it on the first try. I almost failed the sending test, as I had never spent much time doing that. I had never made a code contact before my test, and I have only made a couple since.

The thing about code contacts is they never seem to want to say anything beyond:

WA3XXX DE W6XX RST 5NN WX FB 73 W6XX SK

How does that help the cause of amateur radio?

I have designed and built numerous rf receivers and transmitters, many are employed by the US Army for various uses. I have fixed many different radios from tube stuff through DSP driven affairs.

How exactly did the code help me to do this?

For me code was a means to an end. I wanted my license, so I learned the code.

There were plenty of rude, profane, and generally unpleasant hams on the air back when all had to pass the test in the offices of the FCC. I haven't noticed that things are any worse now. About the only real difference is in the quality of the gear folks are running. It is much better than the crappy stuff that was on the air back in the early 70's.

>
>The frequency is 70MHz.

Then, assuming some type of filtering around that frequency that's
more or less where your system will likely oscillate.

One reason superhetrodyne receivers were developed to replace TRF
receivers was to develop system gain at different frequencies so as to
minimize the chance of oscillation. Another, of course was to achieve
better selectivity that with older technology was better accomplished
at lower frequencies.

Even a single conversion receiver usually develops its gain at three
different frequencies: r-f, i-f and post detection.

You did not specify the chip rate or base band bit rate and spreading function. For GPS signals the chip rate is 1.023 MHz, and the signal spectrum is about 1 MHz wide, so the front end selectivity should be as close to this as possible.

For a terrestrial 70 MHz DSSS system, there are usually going to be several independent DSSS transmitters sharing this 1 MHz bandwidth (or whatever your chip rate is), some being close to the receiver and some very distant.

If you want to receive the distant signal and use the whole 1 MHz bandwidth all the way through the 140 dB gain, a weak distant transmitter producing only 0.1 uV at your receiver antenna terminal would be amplified to 1 V. However a local DSSS transmitter sharing the same 70 MHz band with a different PN sequence could produce 1 mV at your antenna terminal, which should also be amplified by 140 dB to 10 kV, which clearly is impossible ! The strong signals would saturate the later amplifying stages and the weak signal would not get through.

A reasonable gain/bandwidth distribution for a 70 MHz system would be to use a low loss band pass filter with a few MHz bandwidth at 70 MHz, to take out any VHF band I TV signals and FM broadcast signals at 100 MHz. Use a low noise amplifier stage, followed by a filter with deep sides which is matched to the bandwidth of the service (1 MHz for GPS). Then perhaps one stage, possibly with AGC and then the despreader, followed by a filter matching the bit rate (not chip rate) of the signal, followed by multiple AGC amplification stages to amplify the despread signal before the actual BPSK or whatever detector.

In terrestrial systems at 70 MHz the noise temperature is well above 300 K, thus the antenna noise figure is much worse than 3 dB, so trying to keep the receiver system noise figure below 3 dB might not be too productive. It might even be better to suffer an additional 1 dB noise figure hit and use steep filters tailored to the chip rate in front of the first LNA.

When the answer is not clear for our doubts, we argue about it for
better explanation, until the doubts are solved. I think this is a
healthy way to get answers.

I have also found that upon making this the swr can start off high.
What i did was get a small piece of pipe(non cond) and wrap the braded
wire around this about 4-6 times. this stebled thing's out and brought
the swr down to 1.4. using slight ajustments to the lenth and coil gap
of the braded wire and keeping the coax from touching the floor you can
get the swr down to 1.2. so got a load of spare coax and a swr meter
then why not have a go and see if you can improve it again

If this is just a basic IF transformer, you could just buy a radio
and extract the transformer. The radios will be available locally,
unlike just the IF transformer (unless you are lucky enough to be in a
city that still has a store that would carry them).

Buy a radio at a garage sale or a place like the Salvation Army,
and it won't even cost much.

Oh, easily. 25 years ago, technical conversations were dominated by such earth shatteringly important stuff as having a ham down at the repeater site helping other hams tune their transmitters to be on frequency. Other wonderkind were hitting the repeater with a full quieting signal, and turning their power up to try and get a better signal to that DX mobile that breaking up.

If it wasn't that, it was an endless sea of autopatches calling the xyl to tell her that traffic was bad, could she start dinner... or ordering pizza.

>
> Me? I hear no-codes and nickle extras arguing how long a half wave dipole
> should be.

I heard the same things 25 years ago from Generals that got their licenses at the offices of the FCC.

Even 34 years ago, there were study guides that had questions from the pool used by the FCC. If you could memorize the answers to those questions, you were virtually assured of passing. I used the ARRL handbook as my guide.

You didn't answer my questions about the home brew rig you are using.

Hundreds of sources. You looking for traditional cans used in tubes
equipment or PC board mount (transistors radios)

Gold Mine sell 20 can for $ 2.50 (PC mount versions)

Local hamfests here I see NOS 455 kHZ and 10.7 MHz IF cans (case of them) --
in chassis mount style (tube radios).

A Google search should help.

4909. testing ferrite or iron powder toroids as to mix

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-13 18:05:46 UTC
From: dave <foda01@epix.net>
Message-ID: <_zQXg.1894$Db4.268540@news1.epix.net>
Source record: 10009

Hi all,

Is there an easy way to test surplus toroids as to what mix they might be? I have some here with no markings (plain black powder) and I would like to see what frequency ranges they would be useful at. I guess I would have to wind up a transformer and plot the frequency response?

Dave

An Amidon or Ferrite catalog will then give you any other charactersitics
you require.

I had some of my ferrite cores mixed up in my junkbox. What I did is thread them on to a
wire and mark them..so they wouldnt get mixed up again. I took some known torroids and
did some inductance tests at various frequencies ..with 3 or 4 turns of a 7 inch wire. I then
matched up the types that got mixed up. They were all ft37-43 and similar sized other ones of different permeability.
Now with types that are surplus from unknown origin..you may be able to match up inductance vs frequency graphs and match them up to known types of similar/same size.
Ferrites are often used in broadband applications..ie 1.8 to 30 mhz..therefore you have to
select a number of frequencies for test measurements. I use the a frequency in each amateur band.
See my web site:http://www.earlandrews.com for some more details. I use an autek rf analyser for my inductance measurements. I may get around to publishing more on this topic on my web pages this winter..stay tuned. Also..another method is to measure the actual resistance of the core with an ohmeter. I found this to be a very hit and miss and rather difficult method. The inductance vs. Frequency method is easier..but you need a test instrument ..and TIME!! 73 Earl VE3AB

There seems to be a misconception that all iron dust cores are made by
Micrometals and often marketed under the Amidon brand name and that
all ferrite cores are made by Fair-Rite :-).

You can not assume that any colour coding system used by some
manufacturer would apply universally.

> circuit.

Something I've found myself -- and several considerably experienced RF designers have verified -- is that RF coupling and bypass capacitors are often nowhere near as critical as you might think they are. On a real circuit board, by the time you start getting close to the SRF of even a 100nF capacitor, there's usually enough parasitic coupling that what the capacitor is doing just doesn't matter that much. I've used 100nF coupling caps in paths all the way up to 3GHz, and while you *can* see a difference in S21 compared to using, e.g., 10pF, it's really, really small... like, under 1/4dB, and thus the overall response is usually swamped by active devices, loads, etc.

Thus I'm not at all surprised the OP saw absolutely no different when he reduced the 10nF caps to 200pF.

That being said, I wouldn't throw a larger-than-necessary cap into an RF path without good reason. My main point is that the problem of providing wideband coupling is often nowhere near as difficult as it first appears. On the other hand, this implies the well-known corollary that isolation is often a lot *harder* to achieve than we'd like.

The problem is that, if you have 140dB gain at one frequency, you need *over
140dB isolation* from your final output back to the original input to
prevent oscillations from occurring.

140dB isolation is very difficult for reasonable amounts of money!

Magnetic materials do not have a universal colour code like resistors. Their properties are much more complex, including shape and size, and the magnetic properties also depend very much on the ingredients and the processing. Rather like bread, no two products are exactly the same, and it's hard work for manufacturers to maintain consistent quality even in the same material.

If someone has good reason to believe that the cores were made in the USA, then they may well be identifiable from the Micrometals, Amidon or Fair-Rite catalogs. Unless it's a custom shape, the exact dimensions are often the best clue about which company's catalogue to look in. Then a few electrical tests should help to identify one of that company's standard mixes.

On the other hand, cores from other manufacturers and other parts of the world could be almost anything! The only thing you know for sure is that they are NOT made from any "US standard" mix, so they're going to need a separate drawer or bag of their own.

Living in Europe, I have given up buying surplus cores "just in case" they might be useful, because they have almost all been a waste of money and storage space. After wasting time trying to measure and classify them, they have always turned out to be the wrong material or the wrong size for what I needed. As a result of that experience, I now keep almost no stocks of magnetic cores of any kind.

Instead, I keep the money in my pocket, and then buy exactly the right ones for each project, as and when they are needed.

I keep a modest collection of many useful types of cores that I bought from Amidon, from their excellent complete Catalog. The initial expense was a couple of hundred dollars about 15 years ago, but I know exactly what I have, and I save a lot of time and trouble. When I run low on some type I order replacements. I store them in plastic zipper bags with labels. For home experimenting it is a very good way to go. I also have an ancient Boonton Q meter and an ancient surplus HP Vector Impedance Meter.

Yes. My meter is used for low level RF measurement. Primarily I have
been using it for LO measurement and crystal filter construction. It
waspretty simple to build ugly style. The June 2001 article by Bob
Larkin is a good article to read. Calibration will be a concern. I also
created a spreadsheet using the slope formulas provided in excel. I
guarentee you will fine it useful.

AADE has a kit.

Well, I wound 6 turns of #26 enamel magnet wire onto on of the surplus toroids. It measures an whopping 714uH on my Almost All Digital Electronics LC meter.

The toroid measures a bit less than 1 inch OD but definitely more than 0.94". I don't have a set of calipers here but it looks to be about 0.97" based on the ruler I have. The ID is about 0.50 inches. The thickness is about 0.34". These dimensions don't seem to be standard. By the way, here is the listing for these toroids:

http://www.goldmine-elec-products.com/prodinfo.asp?number=G6683

This inductance seems way too high - either I'm getting a false reading or else this not a good material to make RF transformers / inductors with?

I'm mostly working with 2 to 30 Mhz so I am looking for some stuff for that range.

thanks all,

Dave

Built one using an 8307, A/D, and Stamp II. As the other poster
mentioned, depending on what you want to do with it, calibration can be
an issue, for both frequency and amplitude. "Dead bug" style
construction works well with this part, providing a solid ground plane.

Oh, and look on eBay for HP 436 and 437 wattmeters. That part is
cheap. The expensive part is the probe -- 8481, 8482. But even
without the probe, the 436 and 437 have reference sources that put out
1mW into 50 ohms at 50 MHz with better than 1% accuracy.

omit the usual to e-mail me.

Hi; my first post so hope it works.

Yes, I built mine largely on the Kopski circuit. Manhattan
construction.

I made a separate measuring head in a small diecast box with a cable
which plugs-in to the meter unit via a microphone plug/socket.

I also made another head in an identical little box; it contains a
return-loss bridge with an AD8307 as the detector. Works fine up to
650 MHz. It allows quick & accurate return-loss measurements; I call
it my poor man's scalar network analyser. :)

I took a receiver design class at Rockwell-Collins when I was working for them. The guidelines given at the class were no more than 70dB gain at any single frequency. Any more than that, an instability can result. One of my instructers in college told me that with the old school of design, allow at least 1/2 inch of length for each 40dB of gain at a single frequency, and even with those parameters, interstage shields would be necessary. One technique that radio manufacturers is "egg crate" construction.....a die-cast chassis with 1/16th inch walls separating each compartment that contains a module is used.
The better RF generators also use this scheme. Examples of a receiver and RF generator are the Racal 6790/GM and the Boonton 103D, respectively.
If you are still curious if your idea will work or not, I suggest that you actually build the cascaded lineup and find out what happens. Sometimes, the best way to learn about these things is to experience them yourself. I remember the first cascaded amplifier lineup I built when I was going to school. When I asked my instructor why the circuit was oscillating, he asked me where the decoupling networks were. I asked him "decoupling what?". Oh, that's what those 100 ohm / .01uF RC networks were that I used to see in series with the collector/drain resistors. I used to jump out those 100 ohm resistors, thinking that the extra collector/drain voltage would somehow give the radio more gain!
It is always good to ask questions on the NG, but the best way to learn is to actually build the circuit yourself. Nothing like the "school of hard knocks".

Some places you'll find surplus steppers:
Marlin P. Jones Associates, www.mpja.com
Surplus Center, www.surpluscenter.com (usually not many steppers,
though)
Herbach & Rademan, www.herbach.com
There are plenty of others. Some of these also have other drive
components. You may also find just what you need in an old printer or
pen plotter. I have a friend who has a bunch of big old printers and
keeps talking about cleaning out his garage. He'd probably give you
one for free, but you'd have to ship it. You may have someone like
that near you.

You may need to gear down (or otherwise step down the speed) of the
motor to get enough torque to drive the capacitor and inductors.

Especially if you use steppers, you may only need to detect a "home"
position, since you can count steps from there and know where you are
(or rather where the capacitor and inductors are). A continuous servo
system may only need to know the ends of travel, to know that it can't
go beyond those points.

If you want it to auto-tune, you may find it easier to just use DC
motors, though doing so successfully would probably take some
understanding of servo control systems.

Cheers,
Tom

If you decide to use DC motors, and if you decide to drive them from a microprocessor (which would be indicated if you're planning on tuning it under computer control or auto-tuning), this may help: http://www.wescottdesign.com/articles/pidwophd.html.

But I'm not sure that it would be necessary -- as long as you've got _something_ that'll locate the variable components where you want them and does so reliably it doesn't matter whether they're DC motors or steppers.

Be careful sizing your steppers. The biggest drawback to designing with steppers is that if you exceed their available torque they'll quietly fail, and your system will do Very Bad Things. So you want to over-specify your stepper motors by quite a bit.

You'll need to consider two things when doing this: the amount of torque it takes to turn your inductors, and their rotational inertia (which will determine how fast you can accelerate them without causing grief). You can determine your necessary torque experimentally with a lever arm and weights, and you can determine your torque available from a 'mystery motor' in a similar manner -- there's even a web page out there to tell you how to do it, if you look for it.

Once you have selected steppers that are big enough, you'll know their other drawback: they take up a lot of space compared to DC motors with feedback.

But it's easy to understand how to control them, and you don't need to figure out complicated position feedback schemes, so maybe steppers are the right choice for you. If I were you I'd just use a stepper and a pair of home switches -- one to tell me that the roller is at one extreme of travel, and another to tell me that the drum has passed by an index mark. If you 'and' these two signals together you'll get a reliable home. Then each time your system starts up you just run the steppers down to the home position, and back to where you want them.

There is a way around the initial high torque, like friction loads etc. You can use torsion spring/shaft to delay the application of torque to the step motor. Had that problem back at IBM and solved it with torsion shaft spring (Allen key), had invention disclosure on it and it was the only way to get around the problem due to limited space/size of the motor.

SC, tell us all, and don't lie. Do you not agree that a LOT of hams today were CB'ers in the '70's and chose to advance their radio skills by advancing to ham radio? If you disagree, then 1) you're a liar, and 2) did this not help the service? And thusly, if you disagree I suspect you fit into this mold, and choose to deny your past.

Well, in my part of the world, and the parts I can talk to lately, the most negative issues around "ham radio" are on the internet newsgroups, not on the airwaves. It is unfortunate that anyone would take the rantings and attacks of the few obviously "impaired" individuals that continually post crap in the newsgroups, as something that is indicative of the general state of "Radio Hammery". As with any human endeavor, there will always be some bad apples, and in usenet newsgroups, there is absolutely NO filter to keep out the people who wish to disrupt everyone else. At least not yet. Someday, when we all pay for our posts (it's coming, believe me) and we all digitally sign our posts to ensure we are who we say we are, then maybe we'll have civility and normalcy come back to the newsgroups. Until then, at least, the comraderie and decency of true hams will still shine out on the air, in good times and during emergencies, and we will all be seen for what we are, not what a few whackos would like you to believe we are turning into....

Thanks

Dear Slow, I'm a new ham. I passed my Novice Exams in November of 1986, so in Ham Years, I'm a new ham.

What do I like best about appliance operating? I like the features and the ease of cleanup. The new GE range we have allows me to scroll up to the desired operating temperature, and push the "ON" button. Then "Pre" is shown on the temp readout until the oven comes up to temperature. And the smooth glass stove top is a snap to cleanup. If something should boil over, you don't have to lift up the burners and take the spill pans out, etc. Just a quick wipe with a damp dish cloth. It doesn't get much better than that.

Thanks for asking.

When you passed the FCC exam - you are an Amateur Radio Operator period -- plain and simple.

Whether you passed a 20 wpm code test or no code - you are a Ham

Whether you had to draw the schematic for a Colpitts Oscillator or not - you are a Ham

Whether you faced the steely-eyed FCC examiner or a VE -- you are a Ham

Those who say otherwise are shrouded in elitism and a synonym for elitism is snobbery - plain and simple

This is 2006, not 1920

CL

> else this not a good material to make RF transformers / inductors with?
> . . .

There isn't a single material that's good for both broadband transformers and high-Q inductors. For broadband transformers, you want a winding impedance that's at least several times (5 - 10 is a usual rule of thumb) the level of impedance the winding is connected to. Unless you're dealing with a lot of power, the sign of the impedance doesn't matter, except that resistive impedance is desirable because it stays relatively constant with frequency and doesn't contribute to undesirable resonances. So high-permeability ("low frequency") ferrite cores are best for this at HF, since they give the highest impedance per turn squared. These cores are also good for EMI suppression because they're free from resonance effects over the HF range and beyond, and they maintain a relatively constant resistive impedance over many decades of frequency. See the Fair-Rite web site for typical values for various materials.

But the impedance of those high-permeability ferrite cores is typically resistive above a few MHz, and the Q is no more than a few over the entire HF range. So they're not suitable for use as high-Q inductors or tuned transformers. For that purpose, you're almost always better off using powdered iron cores. There are some high-frequency ferrites, but they tend to have a high temperature coefficient and have to be used with care if any DC bias is present, since they saturate much more easily than powdered iron. Also, it's often difficult to achieve as good Q with them as with powdered iron. So I generally use high-permeability ferrite for transformers, and powdered iron for high-Q inductors. There are, incidentally, some low frequency powdered irons which aren't suitable for this application at HF and above. I generally use MicroMetals type 6 material, and occasionally type 2.

What you really need to know is the type of ferrite or powdered iron you're dealing with. You can infer this by measuring the low frequency inductance with an inductance meter, then using that information along with the core dimensions to calculate the material permeability. From there, you can find a likely ferrite or powdered iron type and from a manufacturer's web site get the impedance at the frequency of interest. A much more direct way is to simply measure the complex impedance of a one- or few-turn inductor at the frequency of interest with an antenna analyzer or impedance bridge if you have either of those instruments.

BOTH are important.

If you're not running a homebrew or at least home-assembled rig, who
are you to call someone else an appliance operator?

What good are technical *discussions* if they don't translate into
actual working radio systems?

I have listened to hundreds of CW contacts, and the above is mostly the norm.
I exaggerate a bit, but it is rare that anyone talks about anything other
than a few very simple things. I have yet to listen to a complex conversation
on CW... The most complicated thing I have heard is W1AW code practice, and
some of the traffic nets.

Well, you wouldn't if you spent all of your time on CW. Things are very
polite on those subbands. If however, you ever listened to 20 meters
around 14.313, you might have a different idea of what ham radio was about.
For some reason that frequency was full of profane garbage mouthed hams,
and lots of infighting in the '70s and '80s.

Perhaps, but nothing like some of the very cheap sweep tube transceivers of
the late 1960's, and early '70's. Swans that drifted furiously, and practically
invented the term TVI...

What are the bad HF SSB rigs of today? I would bet that even the absolute
worst is cleaner than anything that was available in the '60's, and '70's...
If only because the regulations got tighter on spurious emissions from new
gear.

...

Nope, I did my Advanced from basic principles. I used the ARRL Radio
Amateur's Handbook as my guide to rules and regulations. The technical
side of my studying came from the handbook, and a variety of other radio
and engineering sources.

>
> It did not have the exact questions and answers in it.

I looked at friend's copy of one of the the license manuals that was available
after my test, and the questions and answers were very close. It was nothing
like the manuals that are available today, but still so close as to be a cheat.

I have built and operated a number of entirely home brew radios. Slow Code
is the one complaining about appliance operators, of which it appears
he is one.

Listening is one thing, participating is another. I've had many, many
CW QSOs that were far more complex than your example. Discussions of
rigs, antennas, jobs, family, plans for the near future (vacation, home
improvement, etc.), experiences in the other's location, and much more.

The stereotypical hello/goodbye QSO is usually the result of these
factors: poor conditions, unskilled operator(s), nature of the QSO (DX,
contest, just checking a new rig)

Of course somebody has to initiate - to say something beyond hello...

Well, I don't know about you. But for me, knowing Morse Code meant I
could build and use simple(r) radio systems to try out an idea.

If someone who isn't a trained electronics person wants to design and
build their amateur radio station, what sort of project should they
build? A complete multiband SSB transceiver? Or a simple CW rig?

Isn't that a reason to promote the mode?

Sure. But how many hams were involved, out of the hundreds of thousands
on the air?

> >>>>> I haven't noticed that things are any worse now. About the only real

Sure - but remember that those rigs were designed 40+ years ago. They
should be judged by the standards of their time.
>

It depends on what you consider "bad". Last FD we had some rigs that
were unusable because they put out wideband phase noise that messed up
stations on adjacent bands! Those rigs might have met the letter of the
law when new, but they sure made a lot of hash in the real world.

OTOH, serviceability of many ham rigs is very low. Even if you can deal
with SMT, a lot of them use house-numbered parts that become unobtanium
in a few years.

Same here - all the way to Extra in 1970.

> > It did not have the exact questions and answers in it.
>
> I looked at friend's copy of one of the the license manuals that was available
> after my test, and the questions and answers were very close. It was nothing
> like the manuals that are available today, but still so close as to be a cheat.

There were a couple of different license manuals available back then.

The ARRL LM was a reprint of FCC's study guide. Those FCC study guides
were produced by FCC to indicate the areas of knowledge you needed to
have for the test. They were essay format even though the tests were
multiple-choice.

AMECO and others rewrote them into multiple choice format.

A fellow named Dick Bash stationed himself outside FCC offices and
bought information from people who had just taken the tests. He was
able to recreate a pretty close version of the actual test by that
method. FCC decided not to prosecute him even though he published books
that were very close to the actual tests.

Then it all became academic with the VE system.

Exactly. *You* are not an appliance operator - nor are you calling
anybody else an appliance operator.

> Slow Code
> is the one complaining about appliance operators, of which it appears
> he is one.

Exactly. I didn't mean to imply that *you* were an appliance operator,
Chuck. Just that if "Slow Code" is going to call other people names, he
should be ready to back up his claims with actions. So far, we see
nothing.

Of course, one should not take "Slow Code" too seriously - if at all.

Kenwood TS-820S. I got a good deal because it had a few bugs. I spent
some of the evenings between the exam session and my ticket arriving
(that would be my GENERAL ticket, I skipped Novice and Technician) going
through it cleaning switches, adding ground straps to a couple circuit
boards and adding 17m to the 'AUX' position on the band switch. By the
time my ticket arrived in the mail it was ready. I worked Clipperton
Island the second day I was on the air and didn't realize it was quite
the DX catch until months later.

So, after your license came in the mail what did you start weenie whining about first?

To promote the mode, sure, but to require it no. I could make the same claim
about RTTY, and Slow Scan. When they were popular, folks on those modes were
all as polite as could be.

The impolite behavior seems to center around SSB. Probably because the mode
requires essentially no effort.

It only takes a few. As I remember from those SSB wars in the '70's and
'80's, a several hams were prosecuted. They were all General Class or higher.
And because of the time frame, in which they were licensed, they had passed
the CW hurdle. I recall that playing with their keyers on the SSB segment was
part of their hijinks. A whole lot of "FU" and other acronyms were mixed in
with the echo boxes, and microphone raking.

And I was. But today's rigs, when judged by the ear are more pleasant to
listen to.

Fortunately, that wideband phase noise doesn't carry beyond a few hundred
yards from the radio. It used to be a really big problem with the early
solid state radios... But not so much so with the newer rigs. Field Day was
where I first noticed the effect.... Key the mike, and all bands were awash
in hiss, even before the first word was spoken. Icom comes to mind.
Having a Clegg FM27B around on field day is a real treat too...not!

> OTOH, serviceability of many ham rigs is very low. Even if you can deal

Entirely the result of meeting the customer's demands for in expensive
feature laden radios that fit in packages smaller than a dictionary.

...

I think my friends "manual" might have been Ameco.

I don't think Bash was doing that until after the VE system came on line...
but I don't recall for sure.

...

Actually, these days for what little operating I do, I am an appliance
operator. Because of my early ham experience, and the fact that I am
an EE, I know how to design and build, even if I don't chose to do so
right now. Ham radio probably figures heavily in my being an EE.

My general belief is if you have passed the test that is in force, you
are a ham... period. Beyond passing whatever is required, I don't care
how you got here, just what you do now that you are here.

-Chuck

funny how the result now is to transfer a lot of the rudeness to CW

4957. Re: step motor info please

Why using stepmotors.

Try to get syngons (or synchrons) instead. These are motor-alike things that you feed with AC and when you turn one of them, the other reciproces. It's like a radio controlled servo but without the usual QRM from the motors.

Cheers

Dan / M0DFI

One way to promote a mode is to give it significant band space.

> I could make the same claim
> about RTTY, and Slow Scan. When they were popular, folks on those modes were
> all as polite as could be.

The difference is that only Morse Code requires skills that the average
person does not have.

> The impolite behavior seems to center around SSB. Probably because the mode
> requires essentially no effort.

Maybe. I think there are many causes.

> >> If however, you ever listened to 20 meters
> >> around 14.313, you might have a different idea of what ham radio was about.

They were a few out of hundreds of thousands.

And yes, they all passed the Morse Code test - supposedly, anyhow. But
they also passed one or more *written* tests which included questions
on acceptable on-air behavior. Why don't the written tests get the
blame?

Look at the recent case of Jack Gerritsen, ex-KG6IRO. What possible
reason is there for his behavior?

> >>>>>>> I haven't noticed that things are any worse now. About the only real

The rigs that gave us headaches were only a few years old.

> Field Day was
> where I first noticed the effect.... Key the mike, and all bands were awash

Bingo.

Are those really customer demands, or are they driven by the
manufacturers who want to sell more radios?

> but I don't recall for sure.

It was the other way around. Bash did his thing in the early 1970s. The
VE system came to be in the early 1980s. The VE system put Bash out of
business because the question pools became public then.

Slow Mind does not know that a Real Ham only uses a radio he built
himself. A Real Ham would not use one of those crappy store-bought
things.

****

| Common name: Woodland Troll |
| Scientific name: Trollus Useneticus |

```
##################################################################
# #
# PHYSICAL CHARACTERISTICS: #
# #
# The common woodland troll (Trollus Useneticus) is an #
# approximately 1.7m long nocturnal furry creature that #
# has been found to exist in nearly every climate and #
# latitude. Predominant features include: a very pale #
# complexion, a large bony ridge above the eyes, a dense #
# cranium, dragging knuckles, and a pungent odor. #
# #
##################################################################

##################################################################
# #
# HABITAT: #
# #
# Most trolls spend the daylight hours under a large rock #
# sleeping. Unfortunately, the natural habitat of the #
# troll has been encroached by development (as is all too #
# common these days). The modern troll has to make due #
# with a slimy, moss covered rock. Often, trolls are #
# forced to endure poor sanitation and filthy living #
# conditions. Combined with the general lack of hygiene #
# among trolls, this results in a very unpleasant odor. #
# #
##################################################################

##################################################################
# #
# ACTIVITIES AND DIET: #
# #
# During their active period at night, the common troll #
# engages in numerous activities, though the most #
# important of these is foraging for food. The one #
# characteristic that ties all different troll species #
# and sub-species together is their diet. Trolls #
# invariably survive off of a combination of cheetos, #
# arguments, and annoying others. A typical troll #
# requires approximately 10 arguments and flames per day #
# just to stay alive. With the increasing use of #
# killfiles and just regular ignoring of trolls, it has #
# become more and more difficult for trolls to eke out a #
# basic sustenance. #
# #
##################################################################

##################################################################
# #
# KNOWN PREDATORS: #
# #
# Unfortunately, trolls have many predators. Most common #
```

```
# among them are the helpful researcher, the informative #
# poster, the cool headed responder, and the kill-filer. #
# The cool header responder is technically not a troll #
# predator however. Trolls are typically unfazed by #
# logical counter arguments and cool headed reason. #
# However, even though their posts do not deliver the #
# same level of sustenance that a "flamer" or an "annoyed #
# poster" may provide, they still provide a valuable #
# source of dietary fiber for the troll. #
# #
# The most dangerous predators for the trolls are the #
# helpful researcher, the informative poster, and the #
# kill-filer. The common troll is highly allergic to #
# fact, real data, and research. Upon skin contact with #
# actual hard evidence and real data, the troll will #
# experience intense itching and burning at the site of #
# contact, followed by lesions and blisters. Eventually, #
# this results in loss of skin near the area of contact, #
# and usually to loss of a limb (in the example of #
# contact near the arm or leg). Contact with facts and #
# data near the facial area usually results in a slow #
# painful death. Contact with extremely high doses of #
# fact and hard data can cause temporary loss of #
# consciousness and even permanent brain damage for the #
# troll. #
# #
# The kill-filer poses a much more insidious threat to #
# the troll. Not posing a direct threat to the troll per #
# se, the kill-filer simply deprives the troll of yet #
# another source of nourishment. Some trolls have #
# developed counter measures to thwart the kill-filers, #
# usually this takes the form of a type of camoflage. #
# #
# The trolls' predators have reaped a terrible slaughter #
# over the years, resulting in the death of great hordes #
# of trolls. Trolls continue to breed rapidly though and #
# their population is stable. However, it is unknown how #
# long this situation can persist. Eventually, natural #
# predators and poachers may result in lower numbers of #
# trolls. Already we are seeing lower diversity among #
# the different troll species. That is why this troll #
# habitat refuge exists, to ensure the preservation of #
# the troll for not only our future, but the future of #
# our children. #
# #
#################################################################

 ========================================================
/ This troll habitat refuge has been paid for in part by /
/ the anti Troll-Defamation League, the International /
```

/ Society for the Advancement of Trolls, and the Troll /
/ Habitat Preservation Alliance. /

I'm sure a lot of hams migrated from citizens band, but up until about the last 16 years, they had to pass a real ham test to get in. Not dumbed down tests like we have today.

I made a lot of contacts on CW. I knew it was what I had to do to be a valuable asset to the service and I had a lot of fun communicating with other CW ops around the world. I was always surprised at how good the Russians were at CW. Doing CW helped me get get my skills up and I quickly passed my 20 wpm Extra. (the real Extra)

Now I try to help other hams and potential hams on radio and on usenet, but the usenet hams are so lazy they don't want to learn anything. They want licensing to be dumbed down some more.

4966. question about self resonant frequency

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-19 23:53:13 UTC
From: Scott <acepilot@bloomer.net>
Message-ID: <6aSdnfruI_Z3kqXYnZ2dnUVZ_r6dnZ2d@bright.net>
Source record: 9967

I want to build a low pass filter for 1296 and have scaled a design out of the handbook. I would like to use chip inductors and chip capacitors for the filter. I was looking at thin film chip inductors (Digi-Key) and they list the self resonant frequency. For an inductor passing 1296, what should the minimum self resonant frequency be? Is 10 GHz enough? The filter is a 5 element Chebyshev Low Pass Filter, inductive input (3 coils in series with a cap at each inner junction to ground), Fco=1290 MHz, F-20dB=2600 MHz. Any other component specs I need to be aware of?

10Ghz would be *almost* an order of magnitude away from the frequency of interest. That should be more than sufficient. The higher the self-resonant frequency, the less parallel capacitance is involved which makes "trimming" the filter less involved. At this frequency your capacitors are going to be pretty small. Parasitic capacitances, such as in the inductor, can make things look pretty screwy in a big hurry.

Inductance of the capacitors, capacitance of the inductors, and loss of both will all affect the quality of the filter. Parasitic inductances and capacitances in the connecting lines and mounting pads will play a role also. Your problem probably won't be so much getting decent response to 2600 MHz (although it won't be easy), but maintaining good attenuation for some range above that. Take a careful look at the highest frequency you have to reject and the required attenuation at that frequency, then decide whether your components will behave as expected up there.

Thanks for the replies...I will probably give it a go and see what happens. I will order values of inductors and capacitors on both sides of my calculated values and play with the circuit until (if) I can get it to work OK. Maybe an appropriate helical filter might be the way to go...

This website has appeared here a number of times before, so it is hardly "new". It's main purpose seems to be to peddle an amplifier which violates 97.315 and 97.317 ... in fact, it seems designed to maximize the number of subparagraphs that may be violated in a single piece of equipment. The website owner appears to be a U.S. based manufacturer (Illinois).

Why not a microstrip filter? Is it that you must have response from DC
all the way to 1296? Would a "no-tune" bandpass filter be more appropriate?

Hello All,
I was wondering what are the differences between a preamp, RF amp and
an LNA.

I was thinking they are all one and the same. Are there any subtle
differences among them for these names?

Thanks.

They all refer to amplifiers, and might be used interchangeably in some cases.

A "preamp" is generally a low-level amplifier, and to be practical I'd expect it would have reasonably low noise. Like the name suggests, it goes at the front of a signal chain. It's a name used at RF, but also for audio and even sub-audio work.

An RF amp presumably amplifies radio frequencies. That's a pretty broad frequency range, and the particular amplifier might well be tuned to a very narrow band, or optimized for some modest range of frequencies (such as 140-150MHz). There's nothing in the name that says it's low power. It could be an RF power amplifier, delivering kilowatts of output. The term isn't very descriptive, but you could add adjectives to narrow it down, like "a low-noise 2-meter mast mounted receiver RF amp."

A LNA -- low noise amplifier -- generally refers to an RF preamp with good to very good noise figure, commonly mounted at the antenna so as to not degrade the system noise figure with the loss from a transmission line. Because they are most useful at frequencies where the atmospheric noise is low, you probably wouldn't find LNAs for use at 4MHz, but they are very commonly used on dishes at microwave frequencies. But again, there's nothing in the name that really tells you the frequency range. The name could reasonably be adopted by audio folk dealing with tiny signals from transducers like moving-coil phono cartridges.

And of course, others may have slightly different (or even very different) slants on the meanings.

Cheers,
Tom

Adding to what others have already posted, you can simulate the filter, with parasitic resistances and reactances and the inevitable transmission line effects, in the freeware RFSim99. You have to be careful to think about the physical layout, and see everything longer than a couple millimeters as a transmission line. The data sheets on the discrete parts should give you a decent idea about the parasitic R/L/C of each package. RFSim99 includes the ability to model self-resonance and Q in inductors and capacitors without adding more parts to the schematic; just check the "use physical model" box for those parts you want to specify for Q and SRF.

And I'd echo what Tim wrote, too: you might want to consider a distributed filter, especially if you can make a PC board with reasonable accuracy. Also, if the goal is to kill harmonics of a single narrow band, you may do better with notches at the harmonic frequencies.

Cheers,
Tom

Hi gang,

Is it not feasible to use a crowbar circuit across a PSU's output if that PSU has a current-limiting feature? I can imagine a situation arising where an over-voltage causes the crowbar to close, generating a short-circuit condition which activates the current limiting. The output will then be stuck at not enough amps to blow the upstream fuse, but enough current to smoke the crowbar (which is not designed to be kept conducting for any length of time of course). Is there some way to have both over-current and over-voltage protection working together in harmony?
Thanks.

I see no problem. If the crowbar is active, the voltage accross it is
about 0V so power dissipation in the crowbar device is minimal. You
could probably use a SOT23 trenchFET as a crowbar which would be
capable of handling a few amps.

Most supplies I've seen with both crowbar and current limiting use fold-back current limiting. When the current exceeds the set limit (due to too heavy a load or to the crowbar firing), the current drops back to a level considerably lower than the limit current, and one which the crowbar can tolerate indefinitely.

Well, it might, but I'm not 100% sure how to determine the lengths and widths of the microstrips. (On my present project, I'm trying an open 1/4 wavelength 50 ohm stripline that I can trim down in length in an attempt to make that line a "short" at the 2nd harmonic.)

The filter only needs to pass from about 1296 to 1300 MHz. I like the idea of a helical filter (except for the cost!) with steep skirts and since my I.F. will be 432 MHz, it will be far enough away so the image will be quite a ways removed and should be way down in level after the filter.

That's exactly what I'm trying on my present project at 902. I have a
50 microstrip line on the circuit board where the RF connector hooks up.
I will etch it to be a 1/4 wavelength at 1802 MHz (2nd harmonic) and
see how that works. If it works OK, I may try the same at 1296...I
might also go with a helical filter...they work nice but can be a bit
pricey!

Look up "Foldback current limiting".

Tim.

Yeah, and not only the crowbar, but the supply itself can likely tolerate it better! :-) Especially if it's a linear supply. Paul: imagine a linear supply designed to deliver 24V at a couple amps. The input to the regulator part might well be nominally 30 volts or more, to accomodate low line input and drop in the regulator pass element. At high line, it might be 33V. In normal operation, the regulator might drop 9 volts at a couple amps, dissipating 18 watts. An SCR crowbar might drop 1.5V. At 2 amps, that only 3 watts, but the regulator would be dissipating over 60 watts. But with foldback limiting, the dissipation would drop in both the SCR and the regulator, staying in pretty much a constant ratio. With a switching regulator, things probably wouldn't be nearly as bad, but the dissipation may still go up in the switching parts if you short the output.

The other thing I've seen is a crowbar for fast response, and a latching shutdown fed back to the supply that holds it off until something is reset.

Cheers,
Tom

Look up the Astron supplies. They will go into a current limiating mode if
the over voltage protection activates. That is if there is a spike or
something. Most of the time something fails (say the pass transistors) that
makes the supply go into the over voltage condition and due to the failed
component the supply can not go into the current limit mode.

Well, most of Helge Granberg's Application Notes are on the Internet (in
various places)

Mike Grierson G3TSO built his 140 watt HF amplifier also based upon Helge's
design,
using the Communication Concepts (CCI) printed circuit board.

Was this the VHF (2-meter) or HF amplifier TX100F from RF Parts ?

it was the tx100 i guess...anyway the links you put up are the ones i
have..(except the component layout ,as i forgot to order!!)

yes you are correct in stating they are based on h.granbergs
designs,which i have,as i stated i guess i could work it out,but it
would be much easier to know the component layout for this pcb..as it
is not exactly as per his design..

regards

You are correct -- this RF Parts kit product is NOT a duplicate of Helge's
design as found in the Application bulletins.

As you have realized you should have ordered the "Plans kit" -- which
included the TX100 circuit board
and the component layout instructions/building that you need.
They just went home (California) for weekend about 2 hours ago --
so send them an e-mail or contact them next week.

Isn't it possible to make a helical resonator with a helix of wire inside a box made from soldered-together pieces of PC board?(*) A filter could be made from a series of these. The Q might not be optimum, but should be good enough for a lot of purposes.

(*) I actually made a two-resonator filter for 450 MHz using this method long ago, but it didn't work well. I came across it recently and checked it with a network analyzer -- I had no decent test equipment back when I made it -- and found that the sections were severely undercoupled. But I haven't tried modifying it to see if it could have been made to work as intended.

Yes, that's all a helical filter appears to be...a coil inside a metal box. I have no idea how many turns, turn spacing and anything else that might be important to the design of one. Fortunately, Downeast Microwave sells a bunch of different helicals for a LOT less than Digikey, but I need the 1305 MHz set and I don't see them at DEMI, so I'll have to fork out $26 each from Digikey (and probably will end up using two) ;(

Offhand, I'd be tempted to use an interdigital filter. There was a nice article about this, including a computer program in basic for the caculations in Ham Radio magizine, Ummm... November 1985 (?).

I used this in a 2400 MHz filter I needed one time and I found the skirt selectivity to be pretty good. Of course, like a lot of wavelength related filters, it had harmonic responses, but a low pass filter fixed that quite nicely.

One pb with SMPS is that when you crowbar its output the input current
is lowered since you ask for lower output power. You'll never blow the fuse.
Another point, depending on the SMPS structure and on the controller
minimum on time is that you have pretty low output voltage when
crowbared (?) which may be too low to reset the inductor current (for
ex. flyback, buck).
In some poorly design supplies this might lead to higher and higher
switch/diode currents, inductor saturation, sill higher currents and
then fireworks.
I prefer latching the fault condition then inhibit the controller, with
crowbar or not, which is what you recommend below.

AFIK a Preamp is used when referring to HF and VHF communciation
receivers. An RF Amp refers to the final stage of a transmitter and an
LNA is generally used when referring to Microwave or sattelite
receiver. I note that the preamp/frontend of the R2 is referred to as
an LNA.

A properly designed crowbar should be able to handle the current and
stored charge of the supply it's monitoring. If a crowbar fails short
in the process, it's still doing it's job, but that is unlikely to
happen if foldback limiting occurs.

OVP and current limiting are both possible using small-signal
techniques, but the OVP's latch may require an independant method of
crossing the isolation barrier for effect.

Actually, a Crowbar System ONLY needs to be able to blow the fuse,
or circuitbreaker that protects the LOAD from the overvoltage
condition that the Crowbar is monitoring. Protecting the supply
from overcurrent draw condition is the Foldback Current Limiter's
Job. Two completely different senerios.

5005. Ferrite antenna com system

Hello all -

I built a simple ferrite antenna communication system. Unfortunately it
won't work if I set the sender more distanced than about a meter. That is
even true with different transmitter configurations.

Here the details:
Transmitter:
ferrite antenna: diameter 8mm , 50mm long
frequency is 77.5KHz, digital modulation is AM 25%
bit-rate is 1 bit/sec (0 is 100ms carrier 25%, 1 is 200ms carrier 25%)
insulated copper wire coil 10 turns

The transmitter is self-constructed and delivers a very good signal.

Receiver:
same antenna copied, but a built-in resonating capacitor.
ready-to-use WWVB 77.5KHz receiver. Demodulated signal goes to scope.

The transmission works over about one meter without any shortage.

Now the problem is that I can change the transmitter parameters but I cannot
reach a substancial greater distance. I changed:
- the coil wound times
- output current to the antenna (measured across a series resistor)
- added an antenna current sensor coil to sense the antenna current and to
see if the ferrite antenna saturizes (NO! Very clean sinusoid)

Googling around to find theoretical aspects of ferrite antenne got no good
results. I spent several hours and read all I can read.

Have someone suggestions to try or good links to read? Especially for:
- when a ferrite or iron powder rod/bar goes in saturation?
- optimal rod dimensions
- optimal coil design (I suggest single layer, resonating with good Q
capacitor, about 3 to 10 turns)
- LNA design for such a low frequency?
- antenna field theory in near-field.

If you need further details please ask.

Thanks in advance.

Regards -
Henry

The propagation mode here is pure magnetic coupling, not a proper electromagnetic "radio" wave, because the antennas are so small compared to a wavelength. Dipole magnetic fields fall off with the cube of distance.

A lot more turns on the rods, and resonating with a cap, will help some. Longer rods would help some, too, but 1/d^3 is a cruel function.

How far do you need to go?

John

The aim is to protect downstream components from overvoltage.
Overvoltage is an indication of loss of control. To count on the
presence of other limiting circuitry, completely independent of the
voltage regulator, may be whistlng for it.

At one time, thyristors with large I^2t characteristics were marketed
for crowbar applications. Nowadays, it might be more sensible to make
use of a semiconductor circuit breaker, integrated into bus sequencing
circuitry.

Hi!

I remember 1/d^4 for a full EM-field here.

The receiver is a WORKING time-code receiver. Working in distance at least 2000km from the time-code transmitter with an EIRP of 30KW. The time-code transmitter have of course a VERY BIG antenna (120m height).
So I'm a little confused of your capacitor idea. That is true?: The transmitter is NOT sending an electromagnetic wave but the same antenna system at the receiving end reads it as an full established EM field?

How far: Hm, several km's if possible. Maybe I should go higher in frequency?
What other small effective antennas work here?

I think the problem is not the minimum turns because I tested it with an original ferrite rod - the same as in the original time-code receiver. It have a lot of turns, probably 100 or more. The same behaviour with 100 turns AND with 10 turns. No difference!

What I understand of ferrrite antenna theory is:
That the coil is simply an impedance transformer and bandpass (with a parallel capacitor for narrow-band reception) to couple the preamplifier to the antenna system (= ferrite rod).

But I miss something. Maybe something with differences between transmitting and receiving with a ferrite antenna. The antenna is not pure reciprocal - because the ferrite (or iron powder) can be nonlinear!

Yes, a ferrite stick antenna works quite well for receivers, but not for transmitters. Try winding a few dozen turns around the whole room - i.e., up the wall, across the ceiling, down the other wall, across the floor, and so on. Or, you could wrap a piece of 50-conductor ribbon cable, and make loops by soldering the ends together offset by 1. ;-)

I don't know very much about antenna theory, but I know that the bigger the better. ;-)

Something's telling me that it's theoretically possible to transmit with a ferrite stick, but from the kind of power you'd have to run through it, it would probably blow up. =:-O

Good Luck!
Rich

1. Ferrite and powdered iron are entirely different materials, with different physical and magnetic characteristics. Powdered iron isn't a good choice for this application.
2. You're not likely to drive either one into a nonlinear region when they're in the form of a rod because of the large air gap in the magnetic path.

In addition to what others have said, the most field you can
generate with the ferrite rod antenna will occur when it is
almost reaching saturation, and that takes a lot of ampere
turns. You can deliver more ampere turns to the rod than
your transmitter output can deliver if you resonate the coil
with a capacitor. That way, you have the current bouncing
back and forth through the capacitor added to the current
from the amplifier. If the coil-capacitor Q is, say, 100,
there will be 100 times more current through the coil than
the transmitter is delivering. This will probably take a
coil with a considerable mass of copper in it.

With this approach, you might reach 10 meters.

So there is a resonant circuit at the transmitter and not just a coil?

With such low number of turns (and hence low inductance), the
capacitor would have to be huge to resonate it at 77.5 kHz. Where do
you get high Q capacitors with such capacitances ?

The resonant circuit impedance levels are quite low in this
configuration (small L/large C), how do you effectively couple power
from the transmitter to this low impedance level at the resonant
circuit ?

The skin depth at this frequency is about 0.25 mm, so any wire thicker
than 0.5 mm will not utilise the full copper wire, so some kind of
Litz wire with separately insulated strands could be used to keep the
coil resistance low.

The inductance of some ferrites varies if there is some DC field
present. This inductance change could detune the resonant circuit and
drop the radiated power. Are you sure that the transmitter coil is not
carrying any DC components or some even harmonic distortion, which
would cause an unbalanced magnetic field in the ferrite rod ?

>- LNA design for such a low frequency?

The band noise is the dominant (compared to "white" amplifier) noise
when listening to the band with your transmitter switched off, the
receiver noise performance should be adequate.

I can't really help you with ferrite antennas for transmitting, but can
tell you that if you google around for "lowfer" and the Longwave Club

of America http://www.lwca.org/ you will find a lot about antenna designs that are suitable for this band. They will also might have recommendations for frequencies of operation that are legal for transmission in your home country (I don't even know what that is!)

LNA isn't really applicable here because there is so so so much man-made and natural noise in this band.

I'm a little surprised that your achieved range was so small from a ferrite rod antenna, actually. Did you really tune both antennas, in place and in circuit, for resonance? The resonance is so so super narrow that strays between design and circuit make a big difference. I mean, CRT screens with flybacks, and faulty flourescent lamp ballasts, and incadescent dimmers radiate all sorts of crap around the LF spectrum for blocks, and they aren't even trying to be intentional transmitters! And don't get me started about induction heaters and welding machines, those can be heard across several states!

Tim.

You made my day :)
BTW: Your idea with the ribbon cable gives you a very easy made
transformator if using clamping connectors. This works very good. I
practiced it 10 years ago.

I heart it several times that a ferrite stick antenna cannot work as a
useful transmitter antenna. But why?????

>
> I don't know very much about antenna theory, but I know that the bigger

Sure, for reasonable antennas. But if the antenna is very VERY big in
relation to wavelength it even cannot work! Read somewhere.

I found no saturation state but I have not enough power at the moment to
drive it very powerful. Something I try later ...

Powdered iron should work better because of the higher permeability even
under heavy load in comparision to ferrite. I think so in theory - not
tested.

Can you explain this more detailed Ron? What will happen with the air gap?
The losses in the air gap radiates and that is the antenna function?

John, that is what I have seen! I resonated the antenna coil and driven it with it's resonance frequency. Seems that the achievable distance was a little more than the circuit without resonating capacitor.

You say, that driving the ferrite rod into saturation will force it to leave more power into air? Why?

Efficient antennas at that frequency are effectively very long
bits of wire. The ferrite rod is small compared to the wavelength
and very inefficient at generating a far field.

This is the antenna of the DCF77 transmitter (same frequency):
http://de.wikipedia.org/wiki/Bild:Dcf77.jpg

Kind regards,

Iwo

I tested it as resonating circuit using the original time-code receiver
antenna AND a second time without the capacitor.
Maybe I got a little more power in the air with the resonating circuit, but
it was not very distingiuable.

> With such low number of turns (and hence low inductance), the
> capacitor would have to be huge to resonate it at 77.5 kHz. Where do

I don't know the exact manufacturer of the time-code receiver ferrite
antenna but I comparable model reads:
L=900uH
bandwidth=700Hz
n=94
see original data
http://www.hkw-elektronik.de/pdfenglisch/AFET100-77,5-DE.pdf
It is not the same antenna but very similar.

The original foil-capacitor is 682 labeled. I don't measured it but I think
it should be 6800pF reading.

For my second experiment I used no capacitor and turns=10.

If I would find a PSPICE model for an ferrite antenna ...

>
> The resonant circuit impedance levels are quite low in this

Hm. I thought here: just trying different turns value to achieve this. The
coil is the impedance transformer for the ferrite rod (=antenna). I'm wrong
here?

>

The original coil is thinner than 0.3mm. If I compare it to my 0.3mm wire
maybe it is 0.18mm. The second experiment with the 10 turns coil is 0.3mm
enamelled copper wire.
I will give Litz wire a try if the system as such works...

Good question. I series blocked DC with a WIMA MKS4 1.0uF 100VDC
high-quality capacitor. As measured the "big" capacitor is outside the
bandwidth of the antenna.

I don't think there is any DC component left. And yes, there is no magnet on
my desk laying around :-)
Is there any internal rectifiation phanomen in the ferrite possible?

> welding machines, those can be heard across several states!

Maybe the time-code receiving IC is a bad design. I don't know. It's
operating current is 500uA only. That is very small. It can receive the
time-code over 2000km with such an antenna with an transmitter EIRP of 30KW.
The receiving antenna is 700Hz bandwidth. I don't think this is super
narrow. Even if we look at the time-code receiver quartz filter with a
bandwidth of about 10Hz I can met it with my stable wave generator. It is a
PLL-design with a clock quartz. Should be typical 10ppm. I don't have a very
good frequency meter to verify it.

In my second transmitter experiment I used a not-resonated driver design. So
there are no problems with detuning the transmit antenna expected. It is
just driven by the 77.5KHz power signal.

CRT screen is off if I experiment. Otherwise I seen a very big CRT signal at
the receiver...

If the two ferrite rods will detune because of the close proximity I cannot
control it. I don't think so.

If you can hear induction heaters or something this is surely with a very
big antenna and a resonable good receiver design.

You misunderstood what I said. It was, " the most field you can
generate with the ferrite rod antenna will occur when it is
almost reaching saturation,"

If you saturate the rod, the field you generate will have lotsof 3rd
harmonic components in it, but little more of the fundamental. I was
trying to emphasize that you will need as strong a magnitic field as
possible aat the transmitting antenna, and just below saturation is
that limit, when a ferrite core is involved.

If the rod has a large lenght to diameter ratio (say , above 10) then I
think the uptimum coil arrangement on the rod also doffers considerably
for the transmitting and receiving cases, since the receiving case does
not deal with saturation.

In the receiving case, the end sections of the rod act as flux
collectors, and only the middle thirs or so has almost all the
collected flux passing through it, so this third is the optimum place
for the coil. /in the transmitting case, the rod has a tendency to
saturate at the center, first, with this arrangement, and you want
essentially the whole rod to approach satuation at the same ampere
turns. This will produce a field that acts as if it has been produced
by the full length of the rod. You can achieve something close ot this
by spreading the turns out, all over the rod, with an extra
concentration (a second or third layer layer, perhaps) at the ends.
Something like this (shown in cross section. View with fixed width

font i.e. Courier, so charcters are on grid pattern):

* = wire in cross section
# = rod

OK Iwo. But why a small receiving ferrite antenna works here? A
non-saturated (=linear, and that means the superposition theorem works)
antenna system is reciprocal as antenna theory predicts. So you should
explain where the difference is!

5022. Amplifier output matching

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-25 17:02:29 UTC
From: Joel Kolstad <JKolstad71HatesSpam@yahoo.com>
Message-ID: <12jv656e84fgeeb@corp.supernews.com>
Source record: 9821

On a reciever, I'm using a MMIC LNA at VHF (2m), and while it's quite clear to me why I need to match at the amplifier's input -- to minimize VSWR and get as much of the signal from the antenna into the system -- it's not quite to clear to me just how important output matching is. The S22 parameters for this LNA are very close to an open circuit with a little capacitance -- I expect the output looks back into a drain or something else that's a reasonably decent current source at RF, and you see that shunted by parasitic capacitances.

So... how important is it that I bother to build a matching network at the output? (I'll be "outputting" to another ~50 ohm input.) It doesn't really seem that important, and building something like an L-match with de-Q-ing resistor drops the gain a couple dB anyway.

I know that for a transmitter output matching is important so that reflections from poor or non-existant terminations don't blow up the output amplifier, but for low-level signals as in a receiver it wouldn't seem to matter so much?

Thanks,
---Joel Kolstad

I understand that. I added a second coil on the ferrite rod to measure the antenna current and set it just below the point where I saw harmonics (or say non-sinusial) waveform on the scope.

That is a very interesting configuration. Never seen such a design. I read about a old-fashion remote controller system having a ferrite antenna transmitter. There someone wrote, the transmitter antenna was a mignon battery-shaped ferrite rod. e.g. much shorter but wider than mine. So an optimum ferrite transmitter antenna is maybe more like a fat battery shaped.

OK, since you called it an LNA, I assume you want to take advantage of the low noise. In that case, you do NOT necessarily want to match the input for low SWR. You want to match to the amplifier's input noise resistance: the equivalent input noise voltage divided by the equivalent input noise current. This in general is NOT the same as the input impedance. Adjust the input match for the lowest noise figure, not the lowest SWR, if it's low noise you want.

Output matching will transfer the greatest power to the load. Assuming S12 is very low, adjusting the output matching will not materially affect the input power, so maximizing the output power will maximize the gain. You may or may not have a need to do that. And you need to pay attention to amplifier stability: is it unconditionally stable, or must you keep the load within some bounds to keep it stable? Have a look for articles about "maximum available gain" and "maximum usable gain." For example, see http://www.microwaves101.com/encyclopedia/kfactor.cfm#mag.

Cheers,
Tom

The problem with loop antennas made of ribbon cable (or other
multiconductor cable connected this way) is the stray capacitance
between turns. The self resonance frequency (without external
capacitor) may be below the band of interest, so you can not resonate
such antenna with an external capacitor.

I found it very useful for design of hard-driven Power MOSFET driver
transformator till 400KHz without problems.

Hi Tom,

Thanks for the information; someone else pointed me yesterday to the idea that you'd generally match the input for optimum noise performance rather than optimum power transfer. The data sheet claims that the optimum noise figure is 0.8dB, but the part itself is marketed as "typical 1.8dB NF" -- which they obtained from their own eval board that, as far as I can tell, was matched pretty close to optimum power transfer. In any case, at present mine is also matched at the input for optimum power transfer, and I'll measure its noise figure and see whether or not I'm around 1.8dB or better... if so I don't think I'm going to worry about it too much.

> Output matching will transfer the greatest power to the load.

Yeah, but it's not practical, is it? I'm looking back at (approximately) a current source, and my load is dictated as (approximately) 50 ohms, so the load itself is what's driving the power transferred, no?

> Assuming

At LF, rarely is the problem "not enough amplitude of received signal",
so past a certain point there isn't much need to make the receiver
antenna more efficient. The problem is always "too much noise!". So
antenna designs are usually built around nulling out local noise, and
loop antennas will get rid of the mostly electric-field local noise.
And they have some directionality (notably sharp nulls) which can help
get rid of specific further-away noise.

Tim.

> load itself is what's driving the power transferred, no?

Well, no... Clearly it's not exactly a current source. Perhaps it's
1000 ohms, or 10000 ohms, (plus some reactance, of course) which is
high but not a pure current source. Then a network that matches 1000
ohms, or 10000 ohms, to 50 ohms (and cancels the reactance), will give
you the most power output. That is a linear, small-signal model, but
that should be a pretty good approximation for any application where
you need a low-noise preamp.

You do need to consider losses in whatever matching network you use;
and many matching networks will be highly resonant to transform between
impedances that are in a large ratio. Realize that the match at the
operating frequency may give you a load at some other frequency which
causes instability...

If the source (the output impedance) was really a current source, you
could get near-infinite power gain (again, assuming that S12 is zero)
by transforming the load to as high an impedance as possible. Consider
the small-signal low-frequency model of a bipolar transistor where the
output is a current source shunted by a resistance. Assume that
(internal effective) resistance is infinite. Now the current from the
current source all flows into the load. Since power is i^2*R,
increasing R increases the power without bound. A matching network
just transforms your practical load (e.g. 50 ohms) to the desired load
R.

What's practical depends on how wide a bandwidth you want, and how good you are at designing and building impedance matching networks. (I can personally come up with lots of IMpractical networks! ;-)

Cheers,
Tom

Ob-flippant remark: Sure you can, you just need a negative capacitor! ;-)

I suppose if one actually built a negative capacitor out of, e.g., a gyrator, the noise performance would be pretty much shot? Might be OK for a transmitting antenna, though?

The effective permeability of a rod is dictated largely by the air gap in the magnetic path, which is a function of the length/diameter ratio of the rod. Powdered iron in general has very low permeability compared to ferrite. If you really wanted to apply a huge amount of power to a rod antenna, powdered iron might be a better choice because of its high saturation flux density. But I doubt you could get the Q of a ferrite rod antenna at the frequency in question, so it would be considerably less efficient. You'd probably end up with less power radiated than if you ran less power to a ferrite rod antenna, and a less efficient antenna would impact your received signal. You'd have to crunch some numbers or make measurements to find out for sure.

> The losses in the air gap radiates and that is the antenna function?

The presence of even a small air gap has the effect of reducing the effective permeability of the core and therefore the inductance of the winding. It also dramatically reduces the core flux density for a given number of winding amp-turns. This makes it very hard to saturate. Inductors used for power applications commonly have a small core gap for this reason. A rod has a very large air gap in the path -- from one end of the rod, curving around outside the rod, to the other. And for many ferrites used at radio frequency, the material loss is high enough that the core would be hot enough to explode well before you reach a flux level anywhere close to saturation. This isn't true of all materials at all frequencies, of course.

The radiation takes place from the field outside the core, i.e., in the air gap. If you didn't have a gap, you wouldn't have any significant radiation.

And it's Roy, not Ron.

Thanks again Tom, you've really cleared things up for me here.

Here's the concrete numbers... in the center of the band, S22 -- converted back to an impedance -- is 119.5-j90 ohms. With a 2V source, if I conjugate match my 50 ohm load obviously I get 1V across the resistor or 20mW = 13dBm. Without a match... let's see... current around the loop is 2/(119.5-j90+50) = 9.2+j4.89 mA, and power in the 50 ohm load is I^2*R = 3.04+j4.5mW = (looking just at real power) 4.83dBm. So... without a match... I'd be leaving 13-4.83 = 8.18dB of gain "on the floor"... ouch!

I'm not so theory funded to explain why a gap in the core transmits
electromagnetic wave. That is an open question for me.
I even don't understand why a ferrite rod will accumulate magnetic field

lines. There is the explanation of "shorten" the field lines way. Some mysterical!

If you talk about explosion: What is the power level you mean?
Currently I have a ferrite rod of 9mm diameter and 50mm length, driven by 40mA against 2Vpp.
Do you think it is impossible to pump maybe 5watts into the rod?

The problem is to pump enough energy in the air to overcome the atmospheric noise seen by the receiver.

BTW: The mentioned antenna array picture is NOT the DCF77 sender. DCF77 is exactly two antennas there only. And they have a very good performance thanks to there big outline. They radiate about 30KW out of the 50KW output power of the final amplifier. If I get 1% performance I think I'm good.

To chime in late: typically the routine in LNA design is noise match
at the input, then conjugate match at the output considering the
effects of the noise match. Really the only reason to play games with
the input noise match is either for broadbanding or to address a
specific stability issue, which usually is better handled by judicious
feedback.

Dunno. If it had to dissipate most of the 5 watts (which is likely), it would get as hot as a resistor that size dissipating the same power, and that would be pretty hot. Just how hot depends on how well insulated it is, how good the air flow is around it, and how much heat is conducted away through the wires or any other physical connection. The first thing I'd check would be the Curie temperature of the ferrite. If you reach that temperature, the material will lose its magnetic properties, so the antenna impedance will abruptly and dramatically change. At some higher temperature, the ferrite will fracture, maybe violently.

If that gets to be a problem, a lower loss ferrite might be necessary. That usually means lower initial permeability, and probably a lower Q inductor. You'll have to determine what the optimum trade would be.

Shouldn't be any trick to feed some power to one and watch its temperature with a thermocouple.

>How much band noise should I expect?

When listening at the signal e.g. through an SSB receiver, it is quite
easy to know the difference. The equipment noise is more or less
constant "hiss", while the band noise is mainly through numerous
distant lightnings.

Some field strength measurements made in England at 73 kHz during the
summer, using a calibrated meter indicated 25 uV/m in 200 Hz
bandwidth, which would produce about 120 dB more power from a full
sized (2 km) dipole than a single matched resistor at the receiver
input.

Thus, even if the actual antenna efficiency was -100 dB and the LNA
noise figure as bad as 10 dB, the band noise would still be stronger
than the amplifier noise.

While an antenna with -100 dB gain would be usable for receiving, such
antenna would be useless for transmitting.

My receiver bandwidth is about 10Hz because of the 77.5KHz quartz crystal filter. So the sensitivity is better. Is 10*lg(200/10) here correct?

It is interesting to learn, that antennas can be noise limited. So reciprocal theorem is not all to know.

Thanks -
Henry

Hello Roy -

I will try your suggestions when I build a more powerful power amp.

As the modulation is AM with known 25% there is a interesting measurement methode possible:
Ramp the amplifier from low to high power and make a curve of the AM modulation depth at the receiver or just with a measurement coil at the transmitter ferrite rod. It should show a saturation if the ferrite goes in saturation. I will try this.
There is an open question what a time constant the ferrite will have if it goes into saturation or out of it. And if this is very different if iron powder is used.

>
> ---Joel

OK, things aren't quite as bad as you've painted them, Joel. Given the
analysis you did for the second half, what you need to do for the first
half is to look at the power delivered to 119.5 ohms with 1 volt across
it. That's 1/119.5 watts, or about 8.4 milliwatts. That's about
+9.23dBm That's the maximum power you can get from that source. Into
50 ohms with no matching, the magnitude of the current is 10.42mA.
The resistor does NOT care what phase angle relative to your arbitrary
reference that is. So the power in that case is 5.43mW, or +7.35dBm.
You've left not 8dB, but just under 2dB, of gain "on the floor."
Things don't get really bad till the mismatch is quite a bit worse than
that. Note that your 2dB occurs with an SWR of about 4:1. At 2:1 SWR,
you only lose half a dB.

Cheers,
Tom

5045. Am transmitter - vlsi project

Hi,
I need to design an AM transmitter as a vlsi project (it needs to be
located on smart dust later on).
Does anyone have any good suggestions were to start from? I am familiar
with vlsi, but don't really know how to implement such a big idea, into
a vlsi simulation and circuit design.
Looking on trasmitter's schemes didn't help, 'cause that's all
resistors, amplifiers and capacitors. How do I translate it into vlsi
design?
Be very glad to any guidance...
Thanks.

Why is this so difficult? Just consider what an AM signal is. Please note that Motorola and I'm sure others have made analog AM transmitter chips beginning a long time ago; they are not "VLSI" by any means. If you'd like to do it more digitally, have a look at the offerings from folk like Analog Devices. Look at their line of TxDACs. Inside some of those chips, you'll find everything you need to make an AM transmitter, given a stream of words representing the modulation you want to apply, and then some.

Is "VLSI" compatible with "smart dust"? Is the power dissipation of a universal all-digital solution compatible with "smart dust"?

You might do well to first list some of the key requirements: output power, size, carrier frequency, modulation bandwidth...

Cheers,
Tom

Hi Mike,
Good luck. I just pulled out my manual, it's an original, and like
you say, there's no info at all on the 10mc timebase ossc. exc. that it's
"ovenized" and takes 9vdc & (I think) 5vdc inputs, and puts out 10mc. I
got mine used at a hamfest probably 15 yrs ago, it was built as a kit,
looking at the marks in the manual. It's worked for me since, after I did
something (can't remember what) in repair.

Hi, Everybody,

I am interested to hear how you have solved the problem of panel-mounting Anderson Powerpole connectors.

I have already ruled out the Anderson 4-pole "Powerpole Pak" connectors. Too bulky. Don't need four. Just need two. I know about these. I am interested in other solutions.

Thanks very much.

Regards,

Al W6LX

Oh, really????
How about THIS one? (QRZ) and a newstory from England?

Quote
Morse code used in rescue!

London, 20 October/GNN/ -- MARITIME AND COASTGUARD AGENCY News Release (Press Notice: 368_06) issued by The Government News Network on 20 October 2006

Yesterday afternoon just after 5.30pm Hayling Island Coastguard team member, Steve Mann, witnessed what he thought was a SOS message flashed by torchlight towards the Control Tower at Hayling Island Sailing Club. Steve responded to the SOS message by switching the lights on and off in the Control Tower.

The casualty was identified and was indeed using Morse code as he had recently transferred all of his safety equipment from his 28ft fishing vessel onto a newly acquired boat. He was running this vessel from Emsworth to Thorneham Marina, a distance of about 4 miles, when he ran aground and started to take on water. Steve Mann then alerted Solent Coastguard Marine Rescue Coordination Centre who requested the launch of the RNLI inshore and D-class lifeboats from Hayling island to the casualty who was transferred to Hayling Island Lifeboat Station, where he was checked over by a crewman who is also a paramedic. His vessel was towed back to Sparks Marina by the inshore lifeboat.

Steve Mann said afterwards, "I was absolutely amazed to see the flashed SOS message. This man was caught out on the one occasion he went to sea with absolutely no safety equipment. Even without radio communication going to sea without even a portable flare is extremely dangerous and could cost you your life."

Please look up "cross posting" on Wikipedia, and note what they have to say about "multiple posting".

Then if you feel the need to cross post (which would have been appropriate here), do so.

I would bet that the person flashing SOS knows little, or no morse code other
than SOS.

This, as an argument for hams using CW, is kind of like "mayday" being an
argument for hams being conversant in French.

Hi fellows!

I'm building a software defined radio that is mostly based on the "Software Defined Radios For The Masses" -articles and are at the point of designing the DDS board. I have two units of AD9954 DDS chips and my idea was to use them parallel, other one with 90 degree phase shift to generate the quadrature signal. This is my first time with DDS, so understanding the control seem to be a little bit difficult for a first timer.

Two questions to start with:

1. I suppose for proper control I need four pins connected from the DDS to the computer (through buffers) I/O update, SDIO, SCLK and Reset, am I correct?

2. Do I have to drive two SDIO serial signals separately for each DDS chip from computer so, that I can define the phase shift for the other DDS (while other one has no phase shift, obivously) ? This came to my mind since the chips don't have any addresses to indentify them.

Thanks a lot!!!

Joel Kolstad wrote:
> On a reciever, I'm using a MMIC LNA at VHF

Andy writes:
Joel, all of the advice I've read on this post is good advice, but
I didn't see any reference to the Linville or Stern stability factors.

Devices, ESPECIALLY at VHF, which are matched into source
and load often oscillate. Hell, they USUALLY oscillate.
Hence , S12 is a major factor in these designs....

Most of the time, devices in this range must be mismatched
to some degree to provide stability.

Motorola used to have an excellent App Note on amplifier
matching, and the degree of mis-matching to ensure stability
It was called " Effects of Y parameters" or " Calculating Stability
in... " or some such, and the number was in the 100s or 200s.

If you know the Sparamters (or Y parameters, for the app note)
you can easily do a Linville on the numbers to see if the LNA
is unconditionally stable for all source and loads.....

It probly won't be.....

Then, you can do a Stern to see what degree of mismatching is
needed to just reach the stability threshold.... If you program
the equations into a computer (I use BASIC but an EXCEL
spreadsheet will work well also) you can quickly decide what you
want to do. Note that the amplifier configuration is the source
of the parameters and not just the device. For instance, common
base is often unconditionally stable while common emitter more
often than not is never unconditionally stable. The S or Y
parameters for the amp in these configurations show it
when a Linville is applied.

It may be that optimum noise figure can't be reached with
unconditional stability..... so you just do the best you can.....
Personally, I've always found the best noise figure while
diddling the circuit, rather than calculating it..... but that's
just my own experience...

Good luck on your design. And don't get so hung up on this
"maximum power transfer Thevin" stuff, since any amplifier that
is Thevenin matched on it's output could only achieve 50% efficiency,
and most amplifiers do a lot better than that..... for the simple
reason that max power transfer isn't the main goal of an amplifier.....

Can you cut a rectangular hole in the panel, slip the Powerpole
connector through (far enough so you can connect its mating plug) and
use a glob of epoxy on the back side to hold the plug to the backside of
the panel?

Lots of good input there, Andy; I appaeciate it.

The part in question claims it is stable working into and from 50 ohms; I do put too much emphasis on matching to that somewhat arbitrary value at times.

Think "nanites" from Star Trek: The Borg Generation.

See: http://en.wikipedia.org/wiki/Smart_dust

It's a popular research topic these days, but as far as I'm aware all the commercial applications are still nowhere near the "grain of rice" size that the proponents would like to achieve -- power sources become a real problem at that size, even if you only do need to communicate with the next node that's only, say, 10' away.

Oh... VLSI is "very large scale integration." It just indicates an IC that has "[mumble]-many million transistor," where the actual number is subjective. A 32 bit CPU is VLSI, a 74LS00 ain't.

Note that the free RFSim99 can display stability circles on the Smith chart display of S11 and S22. They change as you move the cursor frequency, and redraw quickly so it's easy to check over a frequency range.

I don't know why the myth persists that you can achieve no more than 50% efficiency if a load is matched to the source impedance. A Thevenin-equivalent source does not necessarily look anything like the Thevenin circuit inside; it simply behaves WITH RESPECT TO THE LOAD in the same way (over the range of loads and outputs for which it behaves linearly, since the Thevenin model is a linear one). But that's all a red herring anyway: in an LNA, "efficiency" is probably one of the LAST things you should worry about. You should worry about noise. You should worry about stability. And you should worry about distortion. You should even worry about where you'll put it in the system. All those would normally come a long ways ahead of concerns about efficiency.

Cheers,
Tom

Put its S-parameters into a two-port instantiation in RFSim99, Joel,
and you can play with matching and stability to your heart's content.
It won't help you directly with noise, but if the data sheet tells you
about how to match the input for lowest noise, that would be at least a
good starting point for the input network. I think you posted that
it's an MMIC; they often don't provide as good a set of info as do
"bare" transistor data sheets. NEC, for example, seem to do a good job
providing data about S-parameters versus frequency and operating
conditions, and about noise figure versus input matching as well.

Cheers,
Tom

Don't know that particular DDS but did it with two AD9832 used in a vector
impedance arrangement. The master clock and serial clock/data lines were
wired to both chips. Common serial data was sent to both chips but made
'valid' only for the wanted DDS by use of individual "Fsync"(?) lines.
Worked no problem. Chips never got out of step. Phase could be varied at
will.

Hi,

I am wanting to clean out some "junk" boxes of many many types of assorted parts - new, used, salvage, etc.
They're from/for Radio, TV, computer, printer, inventory buyouts, etc.

If you have any parts in mind, PLEASE let me know if in need of any. I'm planning to do some grab bags - relatively CHEAP. The only cost "I" have no control over is "shipping". Though I DO try to ship as cheap as I can and the shipper is usually up to the buyer. Insurance is required - lest you take responsibility for lost, stolen, damaged shipments.

Payments via Postal MO, Pay - Pal, Certified Bank Funds. Personal checks - allow 2 weeks to clear.

Any parts requests?

Some other things among my pile are miscellaneous gauges and colors of wire, AC line cords, hardware, etc.
Not to mention a ton of parts bought from a "closing" Radio Shack. They're going pretty cheap too - certainly cheaper than retail. You can almost get two for the price of one. I have some PC Board material as well. Most is Single sided. SPEAK UP with needs.

Thanks

Lou!

Source record: 9924

For an IF filter, I'm planning on using a an off-the-DigiKey-shelf crystal filter. I need (well, want) to match the filter to 50 ohms.

Could someone verify I'm interpreting the data sheets & terminology correctly?

Say I'm getting an ECS-10.7-7.5A filter, data sheet here: http://www.ecsxtal.com/pdf/mono.pdf ... I'm reading the "termination impedance" as 1800 ohms in parallel with 5pF or, at 10.7MHz, 1800 || -j2975 = 1318 - j797.2 ohms. From reading the application notes on ECS's site, the idea here is that -- for the filter to work as designed -- it wants to "see" 1318 - j797.2 ohms on both the input and output, correct?

I'm also thinking that just because the filter wants to see a certain impedance doesn't necessarily imply that the filter's own internal impedance is the complex conjugate.

Thanks,
---Joel

Actually, I have held an advanced class ticket for more than 30 years.

I took my test at 1919 M Street, NW? Washington, DC. Under the watchful
eye of an FCC examiner. My code test came off of an old signal corps
paper tape driven code practice machine. The key they gave me to use was
from the same set.

My receiving speed was somewhere around 40wpm, and my sending sucks rope.
I never could master an Iambic keyer.

Andy writes:
Joel, whenever I put in a Xtal filter, I make a parallel tank on the
input
and output so I can tune the reactance of the tank to minimize the
ripple in the filter. This is usually part of the source amp, anyway,
and having a high Q tank on the output is only a couple more parts.

You are correct in that the filter "wants" an 1800 ohm source and
load resistance. This can be achieved by impedance matching, or
by termination resistors (whilch will lose a lot of your power). It
is
good for the entire termination to be the input of the next device,
transformed up or down.

The same can be done with the source impedance. However,
the source may not like the Xtal filter as a load, since, even tho you
may have the transformation exactly right, the load presented to
the source is very complex, and may be very high (or low) as soon
as you leave the xtal filter bandpass frequency..... Consequently ,
I have always used a load resistor in the output of the source
amplifier, either as part of the coil Q, or as a fixed value resistor
...... just to
keep the load from going very very high outside of the bandpass
and making the source amplifier go unstable......Sure, I lose a bit
of gain, but a stable amp is more important than an extra few db

of gain....

Finally, the last adjustment is made by sweeping the bandpass
while diddling the input and output tuning until the flattest response
is noted, or at least the response the manufacturer specifies......
I peak the response at the center of the banpass first, then
sweep back and forth to get a flatter response. Usually the
peaking at the center is very close, tho..and if you have no
way to sweep, it will probly work well for voice type signals...
With data signals, well, it just depends.....

It may be useful to build a little jig to test the filter in, using
fixed resistors for source and load, and parallel tanks on both
sides, just to see if the filter does what you think it does. There is

a lot of loss here, but you would only be looking for the response.
If you don't have a sweeper, maybe you can just rock the
generator back and forth with one hand while diddling the
tanks with the other......

Good luck..

Andy W4OAH

A large increase in a receiver amplifier load impedance just outside the passband of a crystal filter (or other types of filter) can cause adjacent channel susceptibility. The network between the amplifier and the filter should be designed to prevent this occurrence. There are networks that can reverse this effect, so the impedance drops instead of increasing. Simulations and impedance measurements can verify.

Andy comments:

A good point. But I am not aware of any passive networks than
can roll the impedance off (or bring it up) fast enough to handle
the adjacent channel problem. Adjacent channels are usually
(in my experience) only a few Khz away while the xtal filter is
usually many Mhz, and a passive network just doesn't change
the impedance that quickly. For those problems, I have always
had to go to a passive resistor source, such as a collector resistor,
or use a coil with a Q low enough to provide the same effect.

If I am incorrect in this, could you please elaborate on what
passive matching circuit you are reccommending. ?

5081. Response to SC

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-28 15:21:16 UTC
From: Roadrunner NNTP <noone@nowhere.com>
Message-ID: <MzK0h.33021$ta3.31232@tornado.texas.rr.com>
Source record: 9932
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.amateur.homebrew,rec.radio.amateur.antenna

I've had enough of SC in newsgroups!

Please don't answer his flaming posts. I would like for my 14 amateur radio operator girl child (who is working on her code) to be able to use newsgroups without this abuse. We should not have to put up with it either.

Copy and forward the following to abuse@earthlink.net. They should be able to identify him from the headers and their logs.

Dear Earthlink Abuse . . .

Please get this clown off of usenet. There are several hobby groups where he posts regularly his inflammatory material, often with profanities. Our kids who are in the hobby certainly don't need to be exposed to this stuff.

Thanks.

Long time internet user and parent.

You don't. Use a kill file. If you don't, you have only yourself to blame.

It;s much less expensive in the long run than screwing around with everyone's
first amendment rights.

If you have the July 1970 QST there is an article starting on page 35 that discusses this situation. The load impedance at the drain of the JFET amplifier increased very rapidly just outside the passband of the xtal filter as shown in Fig 8. The network in Fig 9A inverts the impedance change as shown in Fig 9B. This approach was tested for this article. Pages 39 and 40 show the text that applies to this situation. I have confirmed this approach a few times since then. However, if a fixed resistor is used to load the drain of the JFET this effect is pretty well mitigated. A large increase in the load impedance that the amplifier transistor sees can cause the JFET drain to become overloaded just outside the passband, and I confirmed this in a homebrew receiver that used a particular xtal filter. Different filter design approaches (xtal filter black magic) might produce

results somewhat different than mine, so the problem and the solution always need to be verified experimentally. In general the gain of the JFET etc. must be restricted so that drain overload is avoided at all frequencies, as the article explains. Also, if you have the 2004 ARRL Handbook, page 17.5 column one mentions a similar problem that can occur.

>73 de Janne, OH1GTF

I dying to know how you make out. Here's why:
I have some DDSs, AD9911, I can't get to do anything. They have the
same I/O lines: I/O update, Reset, SDIOs and SCLK. I used a BasicStamp
to control it: Reset high, SCLK it, send in data on SDIO line, then
pulse IO_Update, nothing. Used a 10 Mhz system clock from an HP
generator. Though my one problem is the AD9911 I/Os are 3.3 volts, so
I used resistor divider on the uController outputs to the AD9911 to
drop the level, maybe that has something to do with it, I'm waiting
for 3.3 - 5 v level shiftrs from Maxim to come, MAX3371.

OTOH I strongly suggest that your 14 year old is kept in ignorance
of Usenet until she chooses, as an adult, to venture into it. My 14
year old boy has access to web based groups and I know what they
are. One of the advantages of running a home network is having some
control!

As to the world being hostile at times, I'm sure that your 14 year
old has already worked that out and doesn't need to be exposed to
the abusive behaviour and language that is so common on Usenet!

Thank the lord for kill files :)

Charlie.

Once you master the electronic key you'll wonder how you ever got by
without one. I used a straight key for years and then got an electronic
one. It made code more fun. I tried a bug once, but after using the
electronic key I lost my timing on the side to side stuff.

One thing for sure in the maritime story above, someone did know morse,
and the rescuers probably weren't going to wait for a full message after
the sos. they would start the rescue right away, they didn't need to see a
message.

Whaaaaaaaaaaa!!

Have you ever sat on the toilet and tried to fart your callsign in
morse code?

You're so wound up, I bet you could fart your call at a nearly
perfect 1000Hz square wave.

Al-

I don't recall where I saw it, but there was an article about using the connectors that West Mountain Radio uses in their RigRunners. As I recall, the pair were soldered to a small circuit board and mounted behind a cut-out in the panel. If you can look at one of the RigRunners, it should be possible to figure out how to do it. The only problem is finding that version of the connectors. I'd try West Mountain Radio first.

I understand at least one Ham transceiver has been produced, possibly a Yaesu, with the pair mounted on the rear panel.

Looking for suggestions for a good crimp tool for installing coax connectors. It will primarily for BNC connectors on RG-174, 58 and 59 cables. Although the RG-8 cable family capability would be nice too.

I do wish to avoid being a captive customer in that brand X crimp tool only works well with brand X connectors.

And, of course, looking for the best bang for the buck.

Thanks,

Danny

My take is that the best possible bang for the buck, as it were,
may be had by searching Greed-bay for a surplus mil-spec hex crimper,
such as the Daniels Manufacturing HX-4. This particular tool has
interchangeable dies to accommodate a wide variety of coaxial
connectors, as well as insulated terminal lugs.

They will tend to be more expensive, even at the surplus level,
than your typical made-in-taiwan Paladin (or whoever) crimper, but the
Daniels tools will also be of a much higher quality. Properly cared for,
they may outlast their owner.

As some examples: Item #120044919904 is for a new HX-4 frame, in
its original box, with a Y193 die set, opening bid of $79. Considering
that the frame alone new, from Daniels, is nearly $280, that's quite a
bargain.

Granted, the Y193 die set won't be useful to you unless you're
crimping contact assemblies for the D-sub coax/regular combo connectors,
but it should not be hard to find appropriate die sets for whatever
connectors you want to work with.

A full description of the HX-4, and a listing of common dies for
it, may be found at this link:

http://tinyurl.com/yy263j

Happy hunting.

==========
Crimping might be appropriate for a large volume of coax connectors.
However for a limited number of connectors as applicable to domestic
amateur radio a gland type of cable entry seems more to the point.
BNC- , PL259- and N-connectors are all available with braid sleeve
inserts which highly likely give a better (long term) braid/connector
connection than a crimped arrangement at least for RF ,especially when
used in an outdoor environment.

I do have a short lead with 2 PL259 connectors with both centre pin and body crimped to RG58 coax which probably originates from the 'CB trade' .The braid crimp is not a hexagon but cylindrical with side ridges, like -O- . I would never want to make up leads this way myself.

It is hard to go wrong with any Yaesu or Icom radio. If you find you prefer something else, there will be no problem trading or selling it, assuming you will lose a bit of money after it has been used. Chances are very good you will not want to part with it...I wish I still had my first radio...

If Slow Code left, I would miss him.

I do not agree with him most of the time. As a matter of fact, he is dead wrong a lot of the time.

At least he stands up for what he believes in.

I myself, do not think that every ham should have to be able to send/copy code at 20wpm no more that I think they should be tested on psk,rtty, slow scan tv. etc.

Some people have a passion for code and some have a passion for other modes. I use them all from time to time, and to be honest, after I move next year, I am going to work on my code a bit more when I have the time to do so.

However, I will still give him a hard time about his ranting. After all I have not heard anyone tell him that he is not a real ham because he does not have psk nailed down..HI HI

I was part of the big RRAP CW and anti-ARRL fights of the late 90's up
until restructuring went into effect, then my posting tapered off. I'll
disappear again once the FCC totally kills off ham radio by eliminating
the code requirement. When that happens, I'll wear a strip of black
electricians tape around my arm in memorial and observe twenty-four hours
of radio silence in memory of a once proud service.

Rest in Peace, Ham Radio. You were a good and faithful friend.

I would be prepared to debate this. A properly-done crimp
connection, made with high-quality connectors (I'm talking Amphenol RF
or King) and done with a high-grade crimper will be gas-tight. If you
enclose the whole thing in the sealant-lined heat-shrink tubing after
you've made up and tested the cable, there's no reason it won't do just
as well as a gland type.

And, with crimping, you stand a much lower chance of heat damage to
the insulation. ;-)

I absolutely agree. That's why I suggested the Daniels crimper. Its
dies are all hexagon style, per mil specs.

Keep the peace(es).

5111. Help required with design

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-30 08:08:44 UTC
From: David <dhuisman@bigpond.net.au>
Message-ID: <gqi1h.55702$rP1.41396@news-server.bigpond.net.au>
Source record: 9762

I am looking to hire someone for a few hours to give me advice on a design for VHF ASK radio transmitter and receiver that I have designed.

The design is running but I need to improve sensitivity a bit and TX output power.

If you are interested please contact me by email.

Regards

David

5112. Beautiful women, aged clones, and Ultimate Fighting Championship

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-10-30 12:20:13 UTC
From: skiswim@mail.com
Message-ID: <1162210812.993801.272450@e3g2000cwe.googlegroups.com>
Source record: 9763

Friend,

I'm always looking for good and intelligent individuals like you to visit my website, www.ChezBrandon.com , and it has pictures of beautiful women, information about aged clones, and a link to Ultimate Fighting Championship, a very good show.

My name is Brandon, and I'm in my 20s, am a college student, and as lie detectors, both conventional and unconventional would show, I've never been sexually penetrated. Moreover, I could be shown pictures of X, Y, and Z, and it would show that I'm only sexually attracted to women.

The Murders of Our Leaders in Government were Stopped.

I, Brandon, can take lie detector and psychological tests, and I can go before a panel of truth detecting experts. I tell the truth. A mini-psychological test: 8 times 2 = 16, the world is round, not flat, and the year is 2006. Feel free to call me, my cellphone number is 503.740.0272 (United States based) and feel free to utilize a GK-1 voice truth detecting device too:

>From Congressmen Bill Frist to John Kerry to Dennis Hastert to Hillary Clinton to John Warner to Ron Wyden to Gordon Smith to John McCain to Joseph Lieberman to Nancy Pelosi to Diane Feinstein to Ted Kennedy to anyone else who happened to be in the Congressional chambers during either a joint session of Congress or a State of the Union address from Masons to Skull and Bones members to Secret Service agents to pages to visitors to other good individuals, they all would have been murdered, all of their accomplishments stripped away, their earned wealth stripped away, their homes stripped away, their family and friends stripped away. Moreover, someone else would have been sleeping with their spouses.

Elements of the Mossad, who wanted to bathe in the blood of our Congressmen as well as bathe in the blood of leaders around the world, and when they seized power they would, as confirmed by psychic vision and confirmed auditorially, "he's right; he's psychic," would outlaw most if not all organizations, including the Masons, and these elements as Victor Ostrovsky writes about in his #1 New York Times bestseller By Way of Deception are out of control, notoriously lie, and have a disregard for life -- I was able, thank God, to thwart the conquest of the USA and the world, and was able to thwart the murder of United States and world leaders, via a psychic vision of Senator John Warner and other Congressmen being choked to death by gas, which was confirmed auditorially from both ears, such as "He saved Congress," who they were going to kill "all of them,""how did he know that?" and "he's psychic"

-- murdered my biological Aunt Gloria Atkinson, whom I loved very much, as she did of me, and there is a tribute to her on my website. Please, friend, be sure to barricade your bedroom door at night. I'm not afraid of aged clones or the attempted chopping off of my appendages (elements of the Mossad talked about chopping off my right middle finger and right ear, and 10 out of 10 of my toes, like my right middle finger have unique steeple designs).

I'm not afraid of anything. I'll defend myself to the best of my ability, and I commit my life to saving the lives of men, women, and children and strengthening good organizations. I will always remember my biological Aunt Gloria Atkinson. Sincerely, Brandon

> as well as a gland type.

I keep reading that crimp connections are more reliable than clamp type, but my experience sure runs contrary to that conclusion. I have a sizable quantity of patch and longer RG-58 cables with crimped BNC connectors. Most are from the Tektronix surplus outlet, but some from other industrial sources. All were presumably made by skilled people with the proper equipment, and they were manufactured over a long period of time. Yet on many cables, the outer insulation has pulled out from under the crimp, leaving bare shield. Besides an obvious entry point for water if used outside, the shield wires begin breaking from flexing against the hard crimp connector end. In contrast, I've never had a failure of cables I've made myself with crimp type connectors, although some have gotten very severe and prolonged use.

I imagine that adding sealant-type heat shrink tubing would delay the onset of the insulation migration problem and reduce shield breakage after it occurs. But that's an extra step not required for clamp-type connectors.

In addition, some "precision" cables made with double-shielded cable were very RF-leaky at the connectors, a problem I solved by replacing the crimp connectors with clamp type.

So I have what I've read on the one hand, and what I've experienced on the other. The only conclusion I can reach is that it must be a lot more difficult to "properly" assemble a crimp connector than most people realize. I figure that if the pros have so much trouble doing it right, I don't have a chance. I'll stick with clamp type. My feeling is that the reason that crimp connectors have become so popular doesn't have anything to do with reliability but simply that they're faster to assemble and therefore cheaper.

> And, with crimping, you stand a much lower chance of heat damage to
> the insulation. ;-)

The only heat involved with clamp type connectors is in soldering the center pin. Hopefully most people can manage that -- I've never had a problem, anyway.

Thanks for the help, Andy... I muddled through it (it's a little odd the first time you've normalized your Smith chart to 1800 ohms and the termination is 50 ohms!) and the filters do work as their data sheets say.

I did find that xtal filters can easily drive a network analyzer nuts... even for looking at a single frequency, I had to significantly increase the sampling time well above the default to get a stable display. I'm thinking this is due to the absurdly high Q of the crystals causing a very long transient response, thereby necessitating a long sampling time to finally measure the steady state response.

How are you going to save a life with CW? If someone is having a heart
attack he's not going to be steady enough to type out an SOS to you.

No planes use morse code. No ships do either. Just who do you think is going to send you an SOS?

Many years ago in the TV bussiness we would use a alliance tenna
rotor 4 - wire on a 3 - wire
channel master control box. Now i have the same combination i need to
install on my 6 meter beam
however i fot got the wiring setup?
Does any remember the proper wiring, i think it was combine 1&2 or 3&4
but i cant remember the
setup.

Andy writes:

Joel, one more thing comes to mind.

I like to match impedances using a "double Smith chart". On this
chart,
a normal smith chart is in one color while the mirror image is in
another
color.....
It is called an "impedance-admittance" chart.

One can follow the series reactances along one color, and then
the parallel reactances along the other, to get from the starting
point to the ending part....

Once a person is comfortable using this method, it gives a LOT
of gut feel insight to the various combinations of matching networks
you can use.....

I had to design an automated antenna tuner for Texas Instruments
once, for the HF SSB marine system, and I used the double Smith
Chart to figure out what the combinations needed to be, and then
wrote a computer program that would step reactive elements in series
or parallel . The automated system therefore just stepped along the
curves exactly as I had done by hand..... That was about 30 years
ago.

Anyway, the Smith Chart, and various derivative versions, is great
because you can see a much larger 'big picture" rather than just
discrete values at discrete frequencies..... It's a good and very
useful skill to have... among others..

Yep, that will always work. If you aren't tied to the AD9954, I would suggest
the AD9959 or AD9958. You get 4 or 2 channels in one chip with lots of
control. Cost more, but pretty nice part.

5135. CW to FM Remodulator?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-03 03:58:26 UTC
From: ka9s3@comcast.net
Message-ID: <1162526305.552507.202020@e3g2000cwe.googlegroups.com>
Source record: 9786

I have been looking into gizmos that improve CW copy. Most are audio tone detectors that ignore short impulse noise bursts and then regenerate the CW with a keyed tone oscillator. There are several of these designs around and they are all well and good, but I stumbled across something different and was wondering if any of you have had personal experience with it?

An October 1971 article in Ham Radio magazine (pg 17) titled "high-performance CW processor for communications receivers", "Frequency modulating the telegraphy signals in your receiver provides an interesting and profitable addition to conventional receiver design".

The idea is to sample the last IF of a receiver after as much IF filtering as you can muster, and then using this as the RF input to a FM modulator. The RF/IF is modulated at the audio frequency you like to hear while copying CW. The next step is to frequency multiply the FM modulated signal to increase the bandwidth and up the modulation index. The following step is to treat it like any normal FM receiver IF and run it through a limiter stripping off any amplitude information. The last step is to put the signal into a normal FM discriminator to recover the modulating tone you used.

What this is supposed to do is reduce or eliminate QRN (not QRM) from the CW signal making a "quiet" background to copy the CW.

Have any of you ever done this and how did it work out for you?

- Jeff

Perhaps I'm spoiled by having access to VNAs and spectrum analyzers with tracking generators. :-)

It's sad that *good* spectrum analyzers are still quite spendy, even on the used market. There are several "homebew" spec. ans. out there that are quite impressive, but none that come close to even something like a 15 year old HP 8594.

Andy writes:
Jeff, I haven't tried this method, but one rule of thumb I have
always
believed in is:

"No matter how much you shift, limit, amplify or divide noise, it still
ends up as noise"

The only effective way I have ever found is to narrow the bandwidth
around the signal until the signal starts to get degraded. If done
digitally, it can be done by digital processing, but that changes only
the technique, not the principle...

So, while I would really like to try out some of these "improved
methods",
I am not confident enough in them to spend a weekend wiring together
some hardware.... In my younger years, I probly would've, tho....

Personally, as a CW operator of some 45 years, I have found that my
ears/brain does a lot better job of filtering than one would suppose,
especially
if I am copying some standard message where I sort of know the words
the other fellow will send. I only need 2 or 3 letters per word to
fill in
the pieces with devastating accuracy (grin).....

But, good luck on your efforts. If you do build up something, please

come back and post it here. I am sure that there are many
experimenters who try something like that if someone thinks it shows
promise..... But, please, take some actual measurements. And with
S/N ratios of around the 0 db level. My ear copy can still pick those

out, and many of the "processors" can't deal with noisy sigs in that
region....they tend to fall apart when anything below tangential
sensitivity is received....

Andy,

Thanks for your response. I guess I'm looking for a magic pill (though
I know better). I agree that the human brain/ear combination is
unsurpassed in digging out the really weak ones or the weak signal our
of the pile up. My unfortunate situation is my degenerating hearing. I
now wear hearing aids in both ears and have difficulty understanding
spoken conversation no matter what the volume level. I have always been
a CW only operator so the loss of SSB use doesn't seem so bad. I can
copy CW much better than listen to voices, but I can never be sure that
I can still dig the weak signals out of the mud and I'm pretty sure I
have lost some ability to deal with pile-up QRM. So I'm grabbing at
straws for gizmos to help me out as my hearing digresses.

They're doing amazing things with PCs and soundcards, doing waterfall
plots to pick out weak signals. Perhaps this would work for CW as well

-- and if it does you can take a break from the hearing aids entirely,
and just do it all visually.

Alas, I don't know what the right software to use would be.

Interesting. I recall reading (in QST, no less) of PSK QSO's where
the human ear could NOT even tell a signal was being received, yet
the screen copy was "5x9" (if such a phrase even has meaning in
this context!-)

Sorry to hear about your hearing problem, apparently you have
problems of hearing some specific frequencies.

I don't know if this might help you, but one interesting observation
about a A1A beacon and FM receivers may be of interest.

We have a nearby microwave beacon sending out call sign and locator
using ordinary on-off keying. When receiving the signal on an FM
receiver with the squelch fully open, full quieting is achieved when
the carrier is on, but strong "FM-hiss" is audible, when there is no
signal.

After a while, it was not too hard to copy the beacon message in this
"negative-CW" format.

Since the FM-noise contains white noise, it should be detectable even
if some spot frequencies are undetectable due to selective hearing
loss.

One approach would be to run the CW signal through some kind of FM
receive, limiting the carrier, but producing white noise when no
signal is available (and you would have to learn to copy negative-CW)
or alternatively use some amplitude detector to control a noise gate,
i.e. when there is a carrier present, the white noise would get
through, with no signal, the headphones would be silent.

Just an idea.

Andy writes:

A hard limiter decreases the signal to noise by about 5.6 db, and
that's
a mathematical fact...

If we know the characteristics of the noise, and the
characteristics of
when it occurs and the distribution of the energy, then we have
"a priori" experience , and it really isn't "noise" anymore, and it can
be
dealt with --- in some cases rejected - and it's effects on the
intelligibiliy
of a desired signal made less...

There are two characteristics familiar to a radar engineer, which
deals with detection of a signal in the presence of noise::

Probability of detection -- Which is the probablility that a
signal
will be detected in the presence of noise without
an error.

Probability of false alarm -- This is the probability that
detection of
a vailid signal will occur when there is, in
fact, no signal
present.

Entire volumes have been written on Pd versus Pfa, since this
means

life or death to an aircraft (for instance) when a missle lock may happen.....

If the other guy detects you and sends his missle before you do, you will probly be dead.
If you fire your missles off at a ghost and have none left, you will probly
be dead..

In the final analysis, CW is just On-Off signals, much like pulses.

The bottom line in all this is that if you KNOW what the signal is going to
do you can increase the chances of detecting it properly.

For instance, if the signal is repetitive, it can be stored, integrated,
differentiated, or accumulated with weighing functions to recover the intelligence ---- "a priori" knowledge is necessary..

If you know what the noise is going to do -- impulse, popcorn, static, broadband, random, etc --- you can use techniques to reduce it hopefully without reducing the signal..

So fancy noise limiters, signal enhancers, and innovative detectors will
work on some types of interference, and not on others. To be a universal
S/N improvement, it has to work on "unknown" interference...

That's what the ham bands are like. It could be AM splatter, white noise, a welder machine, the "woodpecker", car ignition..... whatever....

That's what restricting the bandpass does, usually. Sometimes it makes the S/N worse, but only with "special" types of interference.

There ain't no "magic bullet".....

The subject is a LOT more complicated than just any single simple technique for recovering a signal...

However ,our ear/brain, with PRACTICE is an adaptive filter. It's amazing
how well it works, after someone has been copying CW for a while. Perhaps a microprocessor controlled adaptive filter can be made to approach it, but ADAPTIVE filtering is the only hope that I can see, given the different types of QRM and QRN that I have encountered. My best bet is that someday an adaptive CW filter would be to do as good as my own ear could do today.....

It's like looking at a noisy signal on a scope. Someone with a lot of practice can see a valid signal several db lower in S/N than a novice can do.... Sonar operators can do the same.....

"Waterfall" displays simply integrate the signal and noise over time,
which is similar mathematically to restricting the bandwidth as far as
the
S/N "enhancement" properties.... The characteristics of the signal
and the characteristics of the noise are known beforehand, and
that is used, via the display, to increase the Pd and decrease the
Pfa....

End of rant..... I need a beer.

Nah, all HF bands are for sale. Lord help the rest of the world after the
FCC finishes their work. People like SC are the reason for this.

5145. Selecting toroids for HF use...

Hi,

I need some toroidal cores(powdered iron or ferrite) for general HF use. So i guess i will be looking for cores in 3-30~ MHz range. I have access to Philips toroidal cores in where i live and i need your advice to find the suitable one. Waiting for your answers...

Thanks...

5146. Class C amps and saturation (again)

Newsgroup: rec.radio.amateur.homebrew

Back in July I wrote:

I'm reading David Rutledge's excellent "The Electronics of Radio."
In Chapter 10 -- Power Amplifiers, he discusses Class C amps and says,
"In addition, if we drive the transistor clear to saturation, using the

transistor as a switch, the dissipated power can be greatly reduced,
because the saturation voltage is low. This is Class C
amplification..."
I'd always throught that in Class C, while you'd operate the device so
that it was cutoff during most of the cycle, but not saturated.
Is this just a different definition of Class C?
I checked back with SSDRA and EMRFD, and didn't see anything about
driving Class C amps into saturation?
What says the group? Do we saturate in Class C or not?

I've been thinking about this some more. The 1980 ARRL handbook points
out that "Solid State power amplifiers should be operated just below
their saturation points for best efficiency and stability." Also, the
formula that we use to determine load resistance (Rl=Vcc^2/2Po) implies
that we are looking for a combination of Vcc, Load resistance and power
out that will prevent saturation.
And wouldn't we end up with far lower harmonic content if we only clip
one side of the wave form (at cutoff) instead of both sides (cutoff and
saturation)?

I know there are more exotic modes beyond C, but for plain old ordinary
ham radio applications, don't we normally avoid saturation in Class C
amps?

Also, what about this business of having the efficiency improve through
saturation "because the saturation voltage is low" Could that be
right? If you put a voltage across a conductor and generate a large
current, you can't sit back and say "Great! Power consumption across
the conductor is low because the voltage drop across it is now
minimal!"

The definition I've always heard for class C is that conduction of the
active device is for less than half of each cycle. Nothing is said

about saturation.

Of course, if the active device conducts when there is appreciable voltage across it, it will dissipate more power than if it were conducting the same current at lower voltage.

Cheers,
Tom

Suitable for WHAT? You say you "need" them, but what exactly causes
that need? What are you trying to accomplish?

Cheers,
Tom

There is no such thing as a single core type suitable for "general" HF use, because the required core material depends strongly on just what the use is.

You can, however, satisfy a large number of requirements with a few core types. Micrometals type 2 or 6 powdered iron cores are suitable for most high-Q inductors. I consistently measure higher Q with type 6 cores, at least when sparsely wound, but type 2 is convenient for higher inductances due to its higher permeability. I didn't know Philips made powdered iron cores -- if they do, you should check their web site and Micrometals' to find an approximate equivalent. The choice of core material for RF chokes and broadband transformers depends on how much power and how much DC current is involved. For low power applications where there isn't a substantial amount of DC current, Fair-rite type 43 ferrite material is a good choice for those applications. If you need more impedance, for example at lower frequency or in higher impedance circuits, one of the 70 series materials would be better. Again, look at the respective web sites to find an approximate equivalent material from another manufacturer.

The sizes of cores you'll need depends on the inductance (for high-Q inductors) or impedance (for RF chokes or broadband transformers) range, power handling capability, and DC flux level you need to deal with. For low power, low flux applications, (F)T-37 and -50 are popular sizes. These are 0.37 and 0.50 inch OD respectively.

Look at it this way: If you had to drive the device into saturation
before it was class C, then there could have been no class C tube
amplifiers -- yet I see schematics for them all over my older amateur
radio literature.

The definition that _I_ was taught was all about conduction angle.

The "saturation" in bipolar transistor terminology means "current
saturation", but it could just as well mean "carrier saturation". When
the transistor is saturated the base region is stuffed full of carriers
(holes, for an NPN transistor). It takes a while for those carriers to
go away, during which the transistor stays on. This is a very nonlinear
effect, and can be very slow. The old 74Sxx series logic put a

schottkey diode from collector to base on the transistors to keep them
out of saturation, and sped them up considerably.

So yes, with an otherwise ordinary bipolar transistor you probably want
to avoid saturation.
>

That's the whole point of the class D amplifier (AKA switching amp, or
switching supply) at baseband, and the class E amplifier at RF -- you
arrange the circuit so the transistor is either on with low voltage
across it, or off with no current, with as little time in between as you
can manage.

But it's not class C, or at least it isn't _just_ class C.

I don't think you could manage a class E amplifier with bipolar
transistors at RF frequencies, although I'm willing to be surprised.

Thanks for the answers.. I already didn't say that i needed one exact type. They will be used in HF transceiver projects(ie. VFO's, mixers, BPF's and everything). I think that a toroid like T-50-2 would be useful for many applications like those. As i said above i only have access to Philips cores and i can't find a catalog to choose from. I did a search on the net but didn't come accross anything handy. So if any of you have used Philips cores in your applications i would like to know what types do you use and what equivalents are out there for known brands such as Amidon, CWS etc.

Thanks...

The Philips cores that you are referring to were probably manufactured
by Ferroxcube (Philips has sold the company to Yaego). You can find
data and a handbook at http://www.ferroxcube.com/

If you want a useful ham program (free) for designing with Ferroxcube,
Amidon, Epcos and air cores download "mini-RC Calculator" from
http://www.dl5swb.de/html/software_for_amateur_radio.htm

Fair-rite (ferrite manufacturer) has a distributor in your country -
Turkey and they can be contacted at http://www.aktif-neser.com/

The very slow saturation recovery you see in saturated switch applications (unless using a gold-doped transistor) is largely absent in typical RF power applications. The reason is the bipolar drive usually employed -- there's typically a large amount of negative base current available to suck the stored charge out of the base region in a hurry.

This batch of tubes consists of mostly old home radio type, with a few audio
and transmitting types.

PRICES ARE MOSTLY BETWEEN 65% and 75% OFF OF INTERNET TUBE DEALERS

Shipping in USA is a flat $4.00 for whatever amount shipped at one time.
Payment by PayPal, or Credit cards through PayPal, or checks to me.
Any shipments outside of USA will be paid through PayPal only.
I will only ship big orders outside of USA. That's big in money.

See them at:
http://www.muchstuff.com/1024tfs.html

The fractions indicate how they tested on the tube checker. The numerator
is the scale reading, the denominator is the amount on the chart. The
checkers were either my Hickok 6000A or my TV7/U. The tubes may or may not
have boxes. If they are new, then they are in boxes.
N = new. U = used. Tip = glass comes with a tip on top.
BB = brass base. A round glass is like a tennis ball is called ball.
A glass that is larger at the top (like a 280) than at the base is called
ballon.

Please email your orders including the full description, that is tube type
followed
by the TCxxx number which tells me where to find it.
Please, I am not going to pull these tubes to look for more descriptions;
like getter shapes and plate colors.

Thanks to guys like you, there are always plenty of free seats at
club meetings.

If all the seats are taken at a club meeting and a 20wpm code tested Extra
is standing, a no-code ham should give their seat to the Extra and sit
on the floor. After saluting of course.

SC

Not only should the No-Coder give up his seat to a superior, he should also
wipe it clean with disinfectant.

A hard limiter decreases the signal to noise by about 5.6 db, and
that's a mathematical fact...

Andy,

Can you point us to a reference document that explains this "mathematical
fact"?.

Joe

Andy writes:

No. It was about 25 years ago when I was designing the TI2100 FM
Marine
Transceiver for Texas Intruments, which was my last commercial Fm
unit. (Some two meter stuff since then as home projects, tho)

It was info gleaned from several technical papers and I don't for
the
life of me remember which ones. I got a limiter and noise source
and checked it in the lab, at the time, and it seemed consistent.
I don't remember exactly, but I think I combined noise with a
signal and amplified the hell out of it, and then put in an
attenuator to get it back down and measured the S/n in a receiver.
Then I put a limiter in between the amp and the attenuator, and
decreased the atten to get the same level into the receiver, and
measured the S/N again. While I didn't get exactly 5.6 db, I
remember it was close enough to believe that the mathematical
derivation was confirmed (in my mind) and that my measurement
error was probly due to my own imprecision in the experiment..
Anyway, I moved on..... and it settled the question on whether
hard limiting "improves" things.....

Sorry, but that's just one of the numbers that stay with a guy, like
-174 dbm (God's noise) , and 8.5 db (tangential sensitivity), and
10Log(bw), and 3.14..... Heck, I forget my phone number from time
to time, but numbers that I have used for most of my life stay with
me.....

And, being in the profession, I have, at some time or another,
verified
them myself in the lab when the opportunity permitted.. I take that
back.... I have never verified PI..... I hope I haven't been too
gullible..... :>)))

So, I regret not having the mental acuity any more to jot down some
derivations for you. But , if they are not correct, there's a lot of

products
on the market which I built whose development was a wild fluke....

If you want to pursue it yourself, I would suggest a few texts that
have guided me... Skolnik's Radar Handbook (the smal one, not
the BIG one --- I call it " small Skolnik") has a LOT of tech info
that
is presented in a level only slightly greater than the ARRL handbook.
Also "Principles of FM" -- damn, I don't remember the author.....but
how many could there be ? :>)))) I might have it in my workshop.
If I run across it I'll post it here.

Well, good luck. Some knowledge can be passed on as a proven
fact and one needs look no farther..... like PI, for instance... Other
is in conflict with what someone thinks to be "how things work", and
doubt
is in the air.... No matter -- I was the same way, when I had the
energy to pursue it.....

Good on ya' , mate,

Andy W4OAH in Eureka, Texas

So it's not a "mathematical fact" in the sense that any of us can look it up
and see how it was derived, it's your recollection of something you heard
and vaguely remember convincing yourself it could be true, right?

While we're at it, what's the significance of your reference to "8.5 db (
tangential sensitivity)"?

Agilent App Note says:

Tangential sensitivity is the lowest input signal power level for which the detector will have an 8 dB signal-to-noise ratio at the output of a test video amplifier.

As far as I'm concerned... saturation has nothing to do with the class the amplifier is running. I can saturate an amplifier in any class. Saturation is most ofen an undesireable effect... that causes distortion in amplifiers.

I checked Fair-rite's site but couldn't find anything about frequency characteristics of toroidal cores. Also, you know, as a homebrewer i can't buy parcels of material like toroids, and I don't think that distributor can sell small number of items, can they? Anyway, doesn't anyone use Philips toroids, or is there no such thing as Philips cores?

Thanks...

------------ REPLY FOLLOWS ------------

Saturation is only undesirable in LINEAR amplifiers. In non-linear
amps which are often used for CW, RTTY or FM, saturation is good
because it improves efficiency. Distortion in those applications is
unimportant.

Philips is no longer in the ferrite business!! They sold the company to Yaego and it now operates as Ferroxcube. The Philips cores in your area must be available as surplus parts. Use google "Philips Components Magnetics" and you will find old spec sheets.

You can find current toroid data and a handbook at http://www.ferroxcube.com/ They have kept some of the Philips part numbers.

More toroid info at http://www.electronics-tutorials.com/basics/toroids.htm and http://users.catchnet.com.au/~rjandusimports/

Did you download "mini-RC Calculator" ??? www.dl5swb.de/html/software_for_amateur_radio.htm

This program will answer many of your questions.

A friend who was in the TV repair business for many years has given me a large bag of transistors in little plastic squares marked Magnavox factory replacement part and then a serial number. They are all different and I would love to know what their equivalents are. Is there a site or any way of getting this information? Thanks.

Andy replies:
That's right. But just because I don't remember how to derive it,
or can
give you the name of the paper that I read 25-30 years ago, it doesn't
mean it's wrong. So I would suggest you do your own research....

Whether it is true, or not true, IS a mathematical fact, and if you
are
capable of understanding the math proof, you are probably also
capable of proving or disproving it yourself on paper. Me, hell , I
always
had a good lab where I could try things out if I had doubt.....

It is probly easier, if you have access to a good lab, to rig up an
experiment to find out..... That way you wouldn't have to bother with
newsgroups to learn about this stuff.....

I would encourage you to try. If you come up with a good answer you
can be proud of, post it back here for us all to see. I am sure many
people here would be interested , since lots of time is often wasted
coming up with circuits whose purpose is doomed from the start....
such as using "hard limiters" to improve the SNR........

As far as the "tangential sensitivity", you can probly do a google
search and learn all about it.... If you haven't run into it yet, you
probably don't deal with OOK pulses like radar and stuff. There's no
shame in that.....

Andy writes

Well, I saved you some time by googling it myself. It took about 10 seconds
to be able to cut and paste the definition I have been talking about....

Note that in this paper it says TSS is eight db +/- one db .... and depends on several system factors, including the
actual detector used... From experience, the detector type, and the absolute signal level it is detecting, is a BIG DEAL.
It needs to operate in the "perfect diode" region . Doing the detection in the square law region buggers up the measurement.

That +/- one db is due to the accuracy that one operator can set up the
scope versus the next operator that comes along. I use 8.5 db, and I DARE anyone to set the same measurement up 10 times in a row and get the same answer to less than +/- one db.

Agilent probly uses a math derivation to get 8 db to accomplish some specific criteria, and did not specify a detector type, hence it is a "mathematically perfect " answer. Furthermore, they use a different
definition, but ORIGINALLY it was bases on the FIRST SENTENCE in the cut and paste below...

The Agilent App Note that Bill Sabin refers to also came up on the first page of hits, and you can go read it for yourself.

I hope this satisfies your curiousity. I had nothing better to do today..... Now, I'm outta beer, and Jeff Foxworthy is on TV, so 73s

Andy W40AH

**********CUT AND PASTE FROM GOOGLE HIT **********

TANGENTIAL SENSITIVITY
Tangential sensitivity (TSS) is the point where thetop of the noise level with no signal applied is level with thebottom of the noise level on a pulse as shown in Figure 6.

Itcan be determined in the laboratory by varying the amplitudeof the input pulse until the stated criterion is reached, or byvarious approximation formulas.The signal power is nominally 8±1 dB above thenoise level at the TSS point. TSS depends on the RFbandwidth, the

video bandwidth, the noise figure, and the detector characteristic.

TSS is generally a characteristic associated with receivers (or RWRs), however the TSS does not necessarilyprovide a criterion for properly setting the detection threshold. If the threshold is set to TSS, then the false alarm rate israther high.

Radars do not operate at TSS. Most require a more positive S/N for track (> 10 dB) to reduce false detectionon noise spikes.
SENSITIVITY CONCLUSION
When all factors effecting system sensitivity are considered, the designer has little flexibility in the choice ofreceiver parameters. Rather, the performance requirements dictate the limit of sensitivity which can be implemented by theEW receiver.1. Minimum Signal-to-Noise Ratio (S/N) - Set by the accuracy which you want to measure signal parameters and by thefalse alarm requirements.2. Total Receiver Noise Figure (NF) - Set by available technology and system constraints for RF front end performance.3. Equivalent Noise Bandwidth (B) - Set by minimum pulse width or maximum modulation bandwidth needed toNaccomplish the system requirements. A choice which is available to the designer is the relationship of pre- (B) and post-IFdetection (B) bandwidth. The most affordable approach is to set the post-detection filter equal to the reciprocal of theVminimum pulse width, then choose the pre-detection passband to be as wide as the background interference environmentwill allow. Recent studies suggest that pre-detection bandwidths in excess of 100 MHz will allow significant loss of signalsdue to "pulse-on-pulse" conditions. 4. Antenna Gain (G) - Set by the needed instantaneous FOV needed to support the system time to intercept requirements.

On the main page, under "Technical Articles", "Use of Ferrites in Broadband Transformers" has a large amount of information about frequency characteristics. So does "How to Choose Ferrite Components for EMI Suppression".

> Also, you know, as a homebrewer i
> can't buy parcels of material like toroids, and I don't think that

I'm puzzled. . . does Philips sell small numbers of cores directly either? I'm sure some of the folks here can recommend retailers who sell a small number of cores from various manufacturers. The last time I checked -- some time ago -- Amidon was still selling Micrometals powdered iron cores and ferrites from Fair-rite and Magnetics.

There are so many variables and approximations involved that it would seem difficult to be very precise about 8.0 or 8.5 dB S/N ratio or some other number. The decision probably involves the type of signal involved. 8.0 dB in one application gives the minimum acceptible performance for one kind of signal. A more critical system might want more than 8.0 dB to achieve a better bit error rate, for example.

==========
In the UK there are quite a number of small retailers which can supply
ferrite as well as powder iron cores.
www.sycom.co.uk
www.jabdog.com
www.modecomponents.co.uk

Also the G-QRP club sells both types of cores to members.

Andy comments:

Yeah, ... the way I used it was to adjust the level to tangential,
then increase
the signal level with an attenuator to get the S/n I wanted,,,,,

You know how hard it is to put together the stuff to measure the
S/N of a pulsed signal ? Well, by setting it up to get 'tangential"
then
messing with the attenuators to get what I wanted, I could, with
reasonable
accuracy, set up a measurement for 13 o 14 db S/n , or whatever, to
take
the Pfa measurement....

(Those are the S/N levels that reasonable Pfa and Pd numbers occur)

Remember, Tangential Sensitivity was defined 50 years before
Agilent
was in existence... Maybe more..... It allowed a person with a scope
to
make reasonably accurate measurements, and refine their systems to take
advantage of it, 50 years before the simulators, and math, dealt
conclusively
with the issue. Hewlitt was using light bulbs to make audio
oscillators when
RADAR engineers were finding German airplanes....

If my use of the HISTORICAL term has confused these kids that just
got
their BSEE,..... I don't really care....

Why do we respond to these kids ? Probably because we both are
retired and bored.....If they want to prove we are stupid, ...
hell,.... it's
OK with me..... I admit readily to having only a fraction of the math

ability
that I would need to understand all of the things I know to be true...
.... Including Pi.............

Don't worry about saturation. CB'ers think over saturation produces
a better sounding signal. Of course, on ham radio we would call
them Lids.

It can be messy. The class of amplifier is determined by the cut-off (or lack thereof). A class A amplifier neither hits saturation nor hits cut-off. Maximum theoretical efficiency (of a sinusodal waveform) of a class A amp is 50%, but 25% is typical. Very low distortion, of course.

Class B amplifiers are biased at cutoff and only conduct for 50% of the cycle. They shouldn't saturate, however. Efficiencies are around 60%.

Class C amps are typically biased well into cut-off and only conduct for perhaps 90 degrees (25%) of the cycle and can run 70% efficient.

However, there are class D and E amplifiers and they are switchmode amplifiers. They run on or off (cut off or in full saturation). They are normally used for CW or FM and there was a circuit (and components) available from a university to build a cw transmitter using switchmode. The thing ran about 93% efficient!

To add to the confusion, with solid state it *is* possible to use the darn things as a *linear* amplifier! Yep, commercial radio stations now use these things. The problem is that the control circuitry (which, I believe, controls the voltage fed to the final) is very complex and expensive and will be found neither in amateur nor cb equipment for a long time.

Hello all
I am looking for a schematic on the above oscilloscope. The thing blows the fuse at switch on. Any advice would also be appreciated. I know there are many of these old units out there
Thanks in advance

Message-ID: <1162817107.995131.309630@f16g2000cwb.googlegroups.com>
Source record: 9700

Andy writes:

A recent thread from a ham with a hearing disability who was looking for a way to make CW easier to copy caused me to think about something I had seen that might help. I will try to describe it...

The audio output was applied to an amplifier that had an artificial "threshold", like putting diodes in SERIES with the input so that no signal would reach the amplifier until the total level was high enough to break down the diodes ..... only the threshold was more precise and not "soft"..... easy to do with op amps.....

The audio was adjusted to the point where NO signal would not produce and output and YES signal would simply amplify and cause an output...

..... much like adjusting a relay to click in at a given threshold....

Note that this does NOT increase the SNR because that has to be measure with a signal, and when the signal is present the noise is riding on top of it......

However it would produce more "abrupt" contrast between YES signal and NO signal..... much like the FM quieting phenomena that one of the posters in CW Remodulator referred to.....

It might improve the ability to copy for someone with a hearing disability..

I haven't tried it, but I can't see why it wouldn't help.

If a reader has built it up, or something similar, I would appreciate hearing about it..... or possibly where the original article describing it appeared.... I'm sure it was either the ARRL handbook or an old issues of QST....

Just wanted to throw this in the mix. Good luck.

Over 30 years ago I designed and built something similar to what you're describing. I ran the CW signal through a sharp audio filter, detected it with a diode, and used that to key an audio oscillator (rather than amplifying the original signal as you describe). It was interesting, but worked only for a rock-solid signal which was simple to copy anyway. It didn't take much QRN or QRM to cut holes in the output signal which made copy impossible.

The brain is an amazing signal processing mechanism. It's really hard to beat. If I had a hearing disability, I'd look into various amplifying and frequency shaping devices and perhaps some types of audio signal processing. But in my opinion it's best to send more-or-less the original signal to the brain and let it do what it's good at. If that's not feasible, then use a digital mode that's specifically designed for easy detection with electronic circuits and let them do all the work.

Hi Roy,

So much depends on the nature of the hearing problem. I have a lot of holes in my hearing, as well as a different tone of tinnitus in both ears. It took me over 6 months/3 hours per day to learn CW to 5 wpm. And it still had to be crystal clear signal.

I learned a lot of things during this time. The main thing is that my brain gives equal weight to all sounds, whether the CW I am trying to copy, or whatever happens to be around it. Turns out that the same is true for multiple people speaking, or one person speaking with an air conditioner on in the room. This is probably related to the length of time that I have been hard of hearing (started at 7 with a bad case of the mumps, then the tinnitus started at 18)

If you're really a code tested Extra, why do you want to dumb down ham
radio? You should help me push for better radio exams by supporting an
increase in speed of the code requirement. If we can get rid of the
no-codes and nickle hams, test everyone up to 13 and 20wpm, no one will
have to sit on the floor at club meetings anymore.

I don't want to dumb down amateur radio, but you very much want to.
You see, amateur radio is supposed to be about advancement of the art,
```

and preparing and maintaining a civilian population with contemporary communications skills Mandating a mode that has fallen completely out of military and commercial use as obsolete is contrary to the concept of advancement of the art. It is as if blood letting was a required course for a medical degree.

Code is fine for those who like that mode. I use it at least once a month. However, it is no longer the mode that is best in weak signal conditions, or that uses the narrowest band width for effective communication. PSK31 runs circles around code. And guess what....many of the most fervent code guys I know cheat and use computers to print the received code on a screen, and a keyboard to allow the computer to generate their sending.

An amateur extra exam these days covers information a lot more current than that on the exam just a few decades ago. Perhaps instead of harping on code as some indicator of intelligence, you should direct your efforts to having all hams retested on license renewal, to make sure they continue to be current with the state of the art in amateur radio. Or do you believe that de Forest era vacuum tubes are more relevant to amateur radio in the 21st century than integrated circuits?

> design".
>
I finally dug out the article. I haven't a clue to its worth, but
I don't recall that sort of scenario coming up in other places (while
the one about good filtering and using a detected voltage to key an
audio oscillator came up a number of times), which may mean nobody
found it useful, or nobody else could be bothered replicating the circuitry.
What you want to do is check a few issues later, to see if there were
any letters related to it in the "Comments" section.

It's interesting that the November 1971 issue of Ham Radio had an article
entitled "Weak Signal Reception in CW Receivers", which used nothing
cutting edge but was a summation of various things one could do to improve
reception.

Go back a few years, and you'd see an article or two about "under the noise"
CW reception, which of course amounted to PLLs driving some indicator, but
at the time were pretty out of the ordinary since IC phase locked loops
hadn't arrived.

I suspect to evaluate this, one really needs to dig through the magazines
and look at all the schemes. Ham Radio seemed to have a fair number in
the first decade or so. Something about that article you reference reminds
me of something in an article about a Hallicrafter's diversity receiver,
I forget the issue but it likely was in one of the annual October (or was
it November?) receiver issues. About '74 or '75, someone named Hilbert
had some scheme that involved active audio filters, but there was more
to it than I can think of at the moment. (I seem to recall there was
some "stereo" effect, in that different signals were fed to each ear,
which in itself may be worth pursuing. Use one of those schemes with
the detectors to key the audio oscillator, but also include some of
the signal from the receiver output, so you get the noise and the actual
signal in it.) Wait, I think it must have been "Hildreth", who also

wrote this article you reference. In which case, you can look up what he did later; did he see some fault in this system, or did he just realize it was easier to implement something at audio?

Someone mentioned in this thread something that hinted at Coherent CW, which sync'd up the time and frequency at both ends to allow for good filters and fairly deep in the noise CW reception. If you know when and where to look, then it's easier to gather whether there's a signal there or not.

By looking at the various schemes people have come up with, one can get a better idea of each one's worth better than looking at each one by itself.

Some of the schemes likely panned out to be duds. Others required too much circuitry, at least at the time of the articles, so nobody wanted to replicate them. And then likely they've been forgotten, because otherwise more recent technology advances make the past easier (look at how phasing SSB returned to some level of popularity when ICs and digital audio came along). Others, like Coherent CW had the disadvantage that they were a whole system, rather than a processor, so you needed matching stations at both ends in order for it all to work.

You can at least look over the cumulative index of Ham Radio magazine, since someone has put it (or at least some version of it) online at http://webhome.idirect.com/~griffith/hrindex.htm

Ham Radio seemed to be the place to look for that sort of out of the ordinary schemes.

>
It gets the on/off of the keying, but yes it limits the signals. So widely varying signals will be at about the same level (though that may not always be a feature), and any QRN will be limited too.

In thinking about it, I'm not so sure it's all that distant from the schemes that detect the CW and use that to key an audio oscillator. The bulk of the circuitry is not there to improve the CW reception, but to get that needed FM signal, with the incoming CW signal as

the "carrier".

Again, the more I think about it the more I think his later audio based schemes may implement a similar concept.

About tone detection in noise with biaural hearing:
In an ancient magazine article (If I recall correctly it was "dubus") there was a scientific reference mentioned. The signal must be delayed AND a difference in power level feeding it to the ears. They mentioned it is possible to get 3dB improvement with this methode.

Of course, detecting "submarine" is a good search for Google I think. They do worn stereo head phones.

Signal detection in general is how the processing is done:
- online or offline. Offline gives the added benefit of knowing all the signal in advance.
- bit-speed needed (Here the brain is bounded to limits)
- power level achievable (over background)
You can't beat the modern detection systems doing DSP algorithms.

- Henry

5225. How connect two EPP ports to "talk" between them?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-08 00:11:38 UTC
From: mcalhoun@ksu.edu
Message-ID: <eir7bq$7ja@unix1.cc.ksu.edu>
Source record: 9726

Hope this isn't too far off-topic, but maybe somebody who has actually
done something homebrew like this can give me some pointers.

I'd like to connect two PC's with EPP ports so they could "talk" to each
other (mono-directional at any instant but reversible -- probably by
passing a "token" back and forth -- and preferably NOT using interrupts
because I'll be doing most of the programming in a high-level language).

This is a one-off job and I'm not looking for elegance or portability;
I just want something to work reliably.

Maximum cable length will be be less than 10 meters, so propagation
time should be minimal.

The programming, itself, doesn't bother me, but it's how to CONNECT
the two parallel ports and how to implement half of the handshake.

Each port has the following pins/functions available:
DIRECTION: DESCRIPTION(#)
Out: Write
InOut: Data (8)
In: Interrupt
In: Wait
Out: DataStrobe
Out: Reset
Out: AdrsStrobe
In: Spare (3)
Ground: (8)

Some connections are fairly obvious:
* 8 data lines to corresponding 8 data lines
* 1 (or a few) ground line(s) to ground line(s)
* DataStrobe outputs to the other's Interrupt inputs
(but I'll DISable the Interrupts).

Possible algorithm:
Assume one PC is started as SeNDeR and the other as ReCeiVeR:
Not sure how RCVR lets SNDR know it is ready to receive,
but RCVR furiously polls the Interrupt input.
SNDR writes the data to its port.
which causes Write to go low
which causes data to be dumped on the output data lines
Not sure what signal from RCVR should be the SNDR's Wait signal.
but when SNDR's Wait is low SNDR's DataStrobe is set high

Something tells me this just isn't going to work!

HELP! Please!

Has anybody noticed that Super Glue (cyanoacrylate clear liquid glue) just doesn't seem to work any more? I remember when it first came out that it used to bond anything and everything. Lately, seems that I can't even fix my son's toys with it any more.

Latest failure: Just tried to glue a small 12V DC fan for a PA with it and the bond came apart the next day pretty much by itself.

Code is just one part of it. Here's my four step plan that will keep
ham radio from becoming like CB:

Step 1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

Step 2: The passing score for written exams needs to be raised to 85%.

Step 3: Code elements should be 13 wpm for General, and 20 wpm for Extra.

Step 4: Make the no-code license one year non-renewable.

5228. FCC took 11 meters from Hams and gave it to CB'ers.

Switch to two-part epoxy. You will, however, have to wait for it to set.

Actually what the FCC did was to take the 11 meter band and create the
General Radio Service Class C and Class D.
Class C was limited to only a few channels (6) limited to control and
paging. Class D was farmed out as 23 channels with only AM modulation
and a max. of 5 watts power input to the finals. This was later
modified to 40 channels and 4 watts input.
The classic CB'er came just prior to the increase to 40 channels.

Just out of curiosity, is there any reason you can't either buy what you're asking for off-the-shelf in the form of, e.g., LapLink or else use an interface that's better suited to the problem to begin with (such as Ethernet or even those USB "networking" cables)?

The last time I did what you're after here was in the late '80s!

There are certain specific plastics (polyethylene, polypropylene, and
Teflon) which most cyanoacrylates will not bond to properly (either at
all, or without some specialized surface preparation). I believe that
these plastics are characterized by low surface energy.

If what I read in some of the trade journals is any indication,
manufacturers have been selecting newer and more specialized blends of
thermoplastics and thermoset plastics over the past few years, in
order to optimize the cost, strength, impact resistance, etc. of their
products. It would not surprise me if you're more likely now, than a
few years ago, to run into plastic-resin blends which cyanoacrylates
have difficulty "getting a grip on".

A web page at Saf-t-lok indicates that "Surface ionization
pretreatment is necessary to affect best results with instant bonders
on non-polar plastic surfaces such as polyethylene or polypropylene.
SAF-T-LOK® Surface Conditioner does the job."

Cyanoacrylates also vary significantly in their "grabbing"
aggressiveness, viscosity, gap-filling strength, and their tendency to
bloom (emit the classic eye-searing white fumes which then "frost" the
surface around the application point). My impression is that the
newer non-blooming formulations may not grab as aggressively, or hold
as strongly as the classic variety. None of them seem to be
particularly good in gap-filling strength, unless you add an
additional particulate filler (baking soda is sometime suggested).

Abrading the surface with fine-grit sandpaper, and then degreasing
with isopropyl alcohol, can improve the grip significantly.

---------- REPLY FOLLOWS ----------

FWIW: Super glue should only be used for temporary fixes. Even though
it may be strong enough when first applied, it gets brittle after
about a year and loses much of its strength.

Directory > Reference > Wikipedia continuous wave
A continuous wave or continuous waveform (CW) is an electromagnetic
wave of constant amplitude and frequency; and in mathematical analysis,
of infinite duration. Continuous wave is also the name given to an
early method of radio transmission, in which a carrier wave is switched
on and off. Information is carried in the rhythm and spacing with which
the signal is sent. CW is thus is a form of on-off keying (OOK). In
radio transmission, CW waves are also known as "undamped waves", to
distinguish this method from damped wave transmission
is endangered in the first place?

Country seems to be doing fine, Western might be sparse on the ground
but that's the nature of that beast.

Thus, a continuous wave is incapable of conveying
any information.

Um, not quite:-) The very presence of the CW signal conveys SOME
information (e.q. the fact that something is out there generating it:-)

It's the turning on and off of the wave that conveys most of the USEFUL
information:-) Which makes CW communication a DIGITAL mode, by the way.

Harry

Many modern plastics are not effectively glued with plain old super glue (Well, for me modern is anything newer than Bakelite). There are some CA glues that include special activators to help stick to these plastics but they aren't magic bullets, they turn a failed joint into a marginal joint.

If you can rough up the surfaces involved (using more area than just the broken joint) and use a glue that will give a good fillet around the joint, that'll help. There are thick super glues and epoxies that help there.

It's very odd that a fan blade would have broken off all by itself. Usually indicates some sort of mechanical interference (guard loose, maybe bearings so worn that it's rubbing against something else.)

Tim.

FWIW, I've found a product called "Plas-T-Pair" to work in a lot of cases where "super glue" won't. Also, I've been using LocTite 444 "Tak Pak" alpha cyanoacrylate for other things, as it seems to work better than the thin mass-marketed superglues. LocTite 712 accelerator makes it set up quickly. In addition, any joint with stress (esp. tension) on it I'll augment with reinforcement of some sort. Lots of things work: embed a little scrap of cloth in the joint, drill mating holes and put in a peg made from wood dowel stock, or threaded rod (a cut-off machine screw, for example), or roughed-up steel wire, or even copper wire. Even wrapping sewing thread (or small steel wire) around the joint (if the geometry lets that work, so the thread crosses the joint multiple times) works wonders. Apply the idea of reinforcement creatively and you'll pretty much always get a much stronger repair. Even embedding chopped-up fiberglass in the glue will help. Hint: superglue alone is probably going to be fine in compression, so long as it's not subject to shock or excessive mositure, but in tension, it can benefit a lot from some help, especially if it adds reinforcement where the glue joint to the original pieces becomes shear instead of simple tension--i.e., adding pegs in holes.

>From your post, I'm not sure just what part of the fan you were gluing. If it was a broken blade, I'd expect to need to be very careful with the repair because there's a lot of stress on the blade when the fan is running, and adding mass will imbalance the blade if you're not careful.

Cheers,
Tom

I think you will find that cw is making a comeback. Now that the cw
requirement has been serverly reduced, more hams are getting into cw
and it should be starting to make a comback....

Second... I also think you will find that the fcc, and in my country
the IC, are deeply regretting the conversion of 11 meters to 'cb'.
Virtually all of our bad radio operating procedures, of all radio
services, can all be traced back to the bad operating technique found
in the 11 meter cb band....

CW could make a something of a comeback Like AM if it advocates can
learn better manners bothon here and on the air dealing with newer CW
Ops

as it I I suspect MORSE USE is doomed by the attittude of it's
advocates

==========
Super glue (cyano-acrylate) works on the basis of 'exclusion of oxygen'
at the joint ,hence it can often be used effectively for rejoining
broken crockery.

With plastic the break surface is often less 'crisp' especially when
interfered with by tools /sandpaper. Hence an expoxy type of glue is
then more appropriate .

Some plastics can be jointed by hot glue dispensed by a hot melt gun
provided it is done carefully and there is a reasonably large jointing
surface.

Polystyrene can be best (re)jointed with polystyrene glue as used for
model making , or acetone (nail polish remover) when the material at
the joint is dissolved locally by the acetone (a solvent).

Some more facts:

11 meters was never a ham band by international treaty. FCC allowed hams to use it on a shared basis with Industrial, Scientific and Medical users after WW2. This was done in part as a sort of compensation for hams' loss of 160 meters to LORAN after WW2.

The Citizens' Radio Service was created by FCC in the late 1940s. The original Class A and Class B services were on UHF - right where FRS and GMRS are now.

The problem was that, in those days, the UHF radios that performed well were big, heavy, expensive, power hungry and complex. Simple UHF sets that were small, light, inexpensive and simple didn't perform too well.

The Citizen's Radio service had so few takers at the end of 10 years that FCC created Class C and Class D, at 27 MHz. Low power channelized sets for 27 MHz could be made small and inexpensive even with the technology of the late 1950s.

FCC could take the band away from hams because it wasn't a ham band by treaty anyway. They also argued that the creation of the 15 meter ham band in 1954, and the gradual return of 160 to hams, meant that 11 meters wasn't critical to ham radio.

Add to that the fact that 11 meters wasn't the most-popular ham band anyway. Many popular rigs of the time didn't even cover the band. It

wasn't harmonically related to the other HF/MF ham bands of the era, and in many areas it was full of noise from ISM users like diathermy machines, vacuum formers, etc. Since many other countries didn't allocate 11 meters to hams, there wasn't as much DX to work on 11. And the 1.7 MHz wide 10 meter band was right next door.

Of course hams didn't like losing the band, fearing that it was a harbinger of things to come, but it wasn't. Over the intervening years, we hams got all of 160 back, and three new HF bands at 30, 17 and 12 meters. The cb boom of the '70s came and went, and hams are still here.

And switching between the two with various patterns can convey a message.

Those with a brain and who aren't lazy can receive it, those that can't
should stay on CB.

Mac,

You will probably get more responses if you describe what you want in more detail: frequency of operation, inline or test instrument, self contained or PC based, remote head, analog or digital display, cost, commercial or homebrew etc.

I suggest that you take a look at current and back issues of the ARRL handbook and read the articles @ http://www.arrl.org/tis/tismenu.html

Regards - Roger

;-) ANY ideas. ANY schematics, Any The topic is "direct reading" :-)

mac

the best would be:
analogue,
single meter,
1,8-30
of course homebrew - it's r.r.a.h group

As a former user of 11 meters, the Ham Band, this summary pretty much reflects my memory of events. BTW, my old Multi-Elmac AH-54 [if I recall] had 11 meters factory installed. It drifted "slighlty" during each transmission. Slightly meaning 50 +/- KHz. I had to use crystal control to stay reasonably close to any frequency!

Hi Roy and Mike,

Ten Tec made a device similar to the one Roy is describing back in
the 1970's. It was called the S-20 Signalizer and I don't think that

Ten Tec sold very many. I still have mine and use it quite frequently. As Roy said, it was not for weak signal work and most everyone who bought one seemed to think it was just another filter or Q-multiplier that would help dig out weak signals.

On the contrary, the Signalizer works best when you have a strong signal and you just want to get rid of some annoying background sound, like a heterodyne or static crashes. I use mine primarily on 80 meters when there is QRN and I feed its audio to one side of my stereo headphones. The other side of the headphones goes directly to the audio from the receiver so I can hear the raw signal without any AGC action. The advantage of this arrangement is that I can turn the receiver audio down a bit lower than I usually would and still pick up those characters that I would miss completely with the signalizer. It is definitely more comfortable than listening to the raw receiver audio for a long period of time when QRN is present.

Of course, the above arrangement only works because the brain is in fact "an amazing signal processing system", and can selectively insert the weaker signal from the raw receiver audio into the stream of perfect audio coming from the Signalizer.

Mike, I might add that the product review of the Signalizer in QST said that the effect of turning it on was "like closing the door" to shut out the noise from an adjacent room. When I try to describe the effect of the Signalizer to others ("Its a re-keyer, not a filter"), I often use the very analogy that you mentioned, namely that its like being able to lower your voice when someone turns the air conditioner off or other people stop speaking in a crowded room.

You occasionally see a signalizer on e-bay, often misdescribed as a CW filter or amplified speaker. A couple of months ago one went for about fifty dollars as I recall.

I hope not. The FCC providing unlicensed spectrum for the masses was one of the smartest thing they ever did! Yes, it leads to all sorts of horrible operating practices, but CB and -- more contemporarily -- FRS/GMRS and WiFi had provided *huge* benefits for people (and many millions of dollars in equipment sales) nationwide. I'd hate to live in a country where there's no such thing as a license-free $20 pair of FRS-type walkie talkies or $20 WiFi cards for high-speed Internet access.

I'd say they can be traced back to human nature. People were rowdy and "uncouth" in, say, taverns for thousands of years before CB came along.

I'll agree with the uncouth in the taverns part, but, disagree with the context.

CB brought the uncouth out of the tavern and onto the air.

:-)

I haven't seen a lot of examples out there, but the project seems very simple; perhaps trivially simple.

First, you build a directional coupler -- there are a number of designs out there, but none are especially difficult. Then you rectify the voltage and perhaps amplify it. Feed the two voltages into a microcontroller that does the math and operates the display (digital of course). Analog isn't going to be so popular because you not only need a meter (generally harder to get and expensive these days), but you will need some custom meter face, and what it needs to look like won't be all that obvious.

You can get 10 bits on a microcontroller A/D pretty easily and cheaply, more bits will generally cost more, sometimes a lot more. While you don't need terrific resolution for SWR, you will if you want to measure SWR over a wide range of power levels. A lot of micros have 5 or 10 A/D's, though, so perhaps you could get cute and avoid the need for something expensive.

Not many micros have D/As, but many have PWM outputs that can be filtered and would be plenty enough resolution for an analog meter. The cool part of that is that you could have your retro instrument, and you could adjust the output to match the meter face you have.

Of course, if you aren't afraid of a little work, a graphical LCD could be made to display a meter face .. after all, it's only ones and zeroes <g> Some of these color LCDs from cell phones (pricey) are all the rage among some PIC hobbyists these days.

..

Another possibility along these lines would be a little more analog-ish.

Analog Devices makes a line of neat little "log amp" ICs. Feed them a
sample of RF on one pin, and you get out a DC voltage which is
proportional to the log of the RF voltage. They have a wide frequency
range and if I recall correctly the Vout=log(Vin) relationship holds
up pretty well over several decades of power level.

Build two direction couplers, as suggested above, but without the
rectifier diodes. The ARRL handbook has instructions for building
directional couplers for HF out of copper pipe. For a physically
smaller design (for lower power) google around for "stripline
directional coupler", "monimatch", and similar terms, or go to the
Boat Anchors Archive and hunt around for the manual for an old
Heathkit SWR meter.

Take the directionally-coupler-sampled RF signals (forward and
reverse) and run them into a pair of the ADC log-amps.

The two DC voltages which come out will be proportional to the
logarithms of the forward and reverse voltages. If I remember my math
correctly, this means that the difference of the two is proportional
to the logarithm of the ratio of the forward and reverse voltages,
and would thus be a pretty nice indication of the return loss in dB.
Zero voltage difference would mean zero return loss (infinitely high
SWR), and the voltage difference would increase with the return loss
(lower SWR). The upper limit on the voltage difference will probably
be set by the directionality limit of the directional couplers.

Take this voltage difference, run it through a voltage-to-current converter (a.k.a. a series resistor) and into an analog meter, and *bingo* you've got a direct-reading SWR meter. It'll read at the high end of the scale for a 1:1 SWR and will not deflect if the SWR is infinitely high.

It might need to be recalibrated for a proper full-scale deflection at 1:1 on any given frequency, to adjust for the directionality limits of the couplers.

Take a look at the "DEM ABPM" (Down East Microwave All Band Power Meter) at www.downeastmicrowave.com - it's a professionally kitted version of a homebrew product, which uses one of the AD logamps for frequencies from ultrasonic up through UHF, and a less-sensitive-but-higher-frequency Linear Technologies part for frequencies from VHF through microwave. Readout is through a common DC-to-LED-bargraph IC.

Drive by the tavern... tune past the CBers? ;-)

I suppose amateur radio is supposed to be more a high-class dining
establishment than a dinner -- suit, tie, and official FCC-approved membership
required --, although these days you wouldn't necessarily know it from
listening to the airwaves.

Hmmm:

You mean you can quickly tell the difference from some self-important, self-worshiping, self-impressed, carried-away-with-oneself personality as opposed to one considering himself/herself to being a student-of-the-world? And, your final implication being, "This group of amateurs is full of the former?"

You present a most interesting observation! <in-a-contemplative-state>

I think it depends where you listen...

This past weekend, I was active in the November CW Sweepstakes. Made
over 400 QSOs in 74 sections (all states except Hawaii). Lots of
activity but nothing objectionable at all.

I think one reason for the relative unpopularity of 11 meters with hams
was that the band was not harmonically related to other bands, meaning
crystals bought for 11 were probably not useful on any other ham band.

Thank you all for your replies. Tom's treatise on reinforcement was well-taken on this end and is something I am going to try in the future.

The opinion seems to be that Super Glue has not really changed but that plastics have changed into a form not as easily repaired by Super Glue. However, judging from the way Super Glue used to bond my skin vs. how much less so now, I still suspect that a weakening of the formula may have taken place, perhaps in response to a lawsuit by someone who accidentally glued the palm of their hand to the sole of their shoe or something ridiculous like that. Lawyers are continually ruining products and processes for the rest of us as they search for the next target from which to extract punitive damages.

By the way, I never said what kind of failure it was; someone else assumed a fan blade had cracked. Actually, it was one of the supporting struts that had cracked. I am fairly confident that with some reinforcement a crack like this one has a very good chance of being repaired. However, I believe epoxy is better indicated in this particular case as one of the posters pointed out. Epoxy is one tough glue.

Thanks again.

Al

If you're going to be doing the math anyway, analog or digital, and providing some sort of calibration mechanism, you don't need to get too weird about the directional coupler. For HF anyway, almost any old thing will work. It sort of seems a little like black magic. Just stick a couple chunks of wire next to a section of coax with the braid removed and all of a sudden a directional coupler. I think the toriod based couplers are a little more reproduceable, though.

Somebody, maybe even AD, has an RF power chip, too. Not sure of the specifics of it. Might not be too useful for an analog circuit. A lot of the cool chips these days are little bitty thing with lots of legs that you can't hardly see.

DC (coupler) isn't a problem for me. I've made few reflectometers (both HF and VHF) based on homebrew couplers. I've tested toroids, pcb's and copper tubes.

I am rather afraid (terribly afraid) about mistakes in my op-amp mathematics ;-)

Now I'm thinking about ad 8302, 8307 and also (used in my FSM - ad8313)

5287. Re: Class C amps and saturation (again)

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-10 10:24:21 UTC
From: bill.meara@gmail.com
Message-ID: <1163154261.259437.38890@e3g2000cwe.googlegroups.com>
Source record: 9688

Thanks to all who responded. I think I'm starting to understand this. LTSpice helps a lot. I set up a class C amp and looked out power dissipated in the transistor vs. power dissipated in the load. The big efficiency gains that come with saturation were very apparent.

To better understand WHY this happens, I set up a spreadsheet that looked at power dissipated in a variable resistor as it swept from .1 ohms to 10 ohms. It had a fixed 10 ohm resistor in series and 10 volts DC across both of them. Yes indeed, the power disspated in the variable resistor drops off dramatically when the resistance (and hence the voltage across it) gets very low. I guess is why this happens in the saturating Class C amp, Right?

But I still have some questions. When we design a Class A amp, the familiar formula Rload = (Vcc-Ve)^2/2Pout allows us to come up with a load value that will prevent the amplifier from saturating. A load of this value will cause the voltage across the transistor (collector to emitter) to vary from zero to twice Vcc. But it won't go into saturation.

Why then do so many of the books (EMRFD, SSDRA, the W1FB books) call for the use of essentially the same formula for the load when selecting a load for Class C amps? We're no longer worried about staying out of saturation, correct? In fact, we want to saturate. So why the same formula? In fact, it seems to me that if you have a Class C amplifier that is designed with this formula and is operating just below saturation, you can get it to saturate just by increasing the value of the load presented to the collector. Power out and efficiency immediately improves. Linearity, of course, does not.

Thanks, 73 Bill M0HBR

...
In Class A, the active device is conducting the entire cycle, and
conducting in proportion to where you are in the cycle. Because of
that, you can drive a purely resistive load--that is, a non-resonant
load. Class A is used in single-ended broadband linear amplifiers,
such as receiver stages, audio amplifiers, scope vertical amplifiers,
...

In Class B, each active device is conducting for half the cycle. If
you use a single active device, you need a resonant tank to complete
the cycle. You can also have push-pull class B where one device
handles output voltages of one polarity, and the other handles output
voltages of the other polarity. It is usual to bias the active devices
in such a case slightly into class A, so that the nonlinearities right

at the half-cycle point can be smoothed over. But class B in a single ended RF amplifier, with a resonant tank at the output, is still capable of linear performance, because you can reduce the conduction during the active half-cycle and reduce the output amplitude in proportion.

In both Class A and Class B, it's possible for the output to peak with the active device having a very low voltage across it, so that the the output peak-to-peak amplitude at that point is still two times the supply voltage, or nearly so, assuming it's a good approximation of a sine wave there. For class A and B amplifiers, though, the output amplitude may be less than that. The efficiency obviously goes toward zero as the output amplitude goes toward zero, since some conduction in the active devices is required to drive any output, and the dissipation in the active device is proportional essentially just to the current at low output swings since the voltage on the device is nearly constant; but the power to the load is proportional to the square of the current.

In Class C, the active device is hard-on for a relatively small fraction of the cycle. It always drives the output to about two times the supply voltage, peak to peak, if it's properly designed for low dissipation in the active device. But a key difference between it and class A is that the active device is conducting essentially no current except when there is only a very low voltage across it. In class A, there's current through the device at all output voltages.

So at full output in all those cases, the peak-to-peak voltage is the same, and for a given output POWER, that tells you what the effective resistive load should be at that point.

(In Class D, the voltage at the output of the active devices swings very quickly between power rails, spending most of the time at one rail or the other, and the output is varied according to the duty cycle of the rectangular waveform there. That waveform is filtered to remove the switching frequency and its harmonics. The result can be a very efficient amplifier. They are becoming common in audio applications these days.)

Clearly there's a bit more to it than that simple explanation, but it's a first approximation that may get you going...

Cheers,
Tom

I've designed saturating RF amplifiers of a few watts output in which the device is on for well over half the cycle, and which have an efficiency of around 90%. The peak-peak collector voltage is nearly 40 volts when run from a 12 volt supply. The high efficiency implies relatively low dissipation in the active device. But perhaps this falls outside some definitions of class C.

Solder a three watt 50 ohm non-inductive resistor directly into a
PL-259 and there you are. Use a double-female barrel adaptor as a
gender changer when needed. That will stand five watts momentarily, or
better yet, get an SWR analyzer such as the MFJ units. They are much
handier than an SWR bridge anyway. I wouldn't be without one.

Removed all the crossposting, since only retards crosspost.

I am a slow code extra, and proud of it. However, if every ham that passed the tests 40-50 years ago was retested now, how many would still pass? I know one local ham that has been active since the 1950's and still is an advanced, he can repair or build all his own gear, but still isn't able to pass the extra exam. Put a current extra exam in front of most extras, I don't think they would pass. I would be in favor of periodic retesting, just like driver license vision testing, every 10-20 years you have to repass the level of test for the license you currently hold.

And I am not afraid to use my real name and callsign or to build my own equipment since that is what this group is really about inspite of the misguided attempts of trolls to disrupt it.
thanks, John.

An even better solution would be to cobble the destination drive
into the source-drive's PC, do a big XCOPY, and uncobble it.
Unfortunately, in my situation the drives are NOT compatible, either.

Neither do the computers I'm working with have Ethernet or USB.

And there's almost a times-100 ratio in speed; to copy a 1 gig
disk via laplink will take about 24 HOURS vs about 17 MINUTES via
the parallel port.

Besides, there's always the fun of doing it, and that much time
difference should even "pay" for the programming effort.

At least one version of laplink that I remember used the printer port for connecting.

Along a similar vein, there was talk in comp.os.cpm a couple of weeks ago about a utility that allowed a dos machine to function as a disk drive for a cp/m computer via the printer port, perhaps if you look that one up, you can write a util that allows your machine to do the same. At least it should help get you started.

In my opinion writing the utils to do it will take more than 24 hours, if you start the copy now it might just be done before you finish writing the utils.

Cross opsys transfers are done here the slow way with some form of xmodem or zmodem at 19.2k, it may take a while but it works just fine while I am asleep.

A flyback switching RF amplifier, Roy? ;-) One can also use active devices that pull hard to ground and to a rail, delivering a square wave output at high efficiency. That square wave can then be filtered with a network that presents a high impedance for harmonics and passes the fundamental, and achieve very high efficiency. A square wave is nice because the even harmonics are theoretically zero, and in practice can be much lower than the odd, so the filter doesn't have to have super-steep cutoff. I guess that would be some variation on class D. It's actually the way the HP8640B generates its signal: divide-by-2 stages from the master oscillator, followed by filters. I suppose it's really best to describe the operation of any amplifier in some detail, and not just rely on "Class A" or the like.

Cheers,
Tom

There is no formula for calculating how much you
can exceed the maximum ratings of a component.

I have found that most resistors can withstand several
times their maximum rating for brief periods. A lot
more if you submerge them in oil.

You don't want to do any high power tests while you
are up the tower or on the roof. High power = high
voltage = a long fall if you get a shock!

I got into this a little late, but I'm also assuming in this case that there are no standard, common media (CD, DVD, etc.) either. Somewhere around here I still have a file transfer program which came with a null modem cable, but also gave instructions on how to build a parallel port cable. IIRC, the data lines were 1-to-1, but some control lines were switched. Would this data be helpful or do you already have this information?

5304. Labeling mobile antennas?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-11 15:52:47 UTC
From: Doug Smith W9WI <w9wi@invalid.invalid>
Message-ID: <4555F1CD.5030809@invalid.invalid>
Source record: 9605

I operate mobile with a number of Hamstick antennas - fiberglass rods ~1/2" (1.3cm) diameter with stainless steel whips at the end. A separate antenna is necessary for each band.

The antennas come with paper tags at the bottom indicating which band they're for. These are surprisingly durable, but they aren't perfect. The 20 meter antenna has lost its tag - luckily right now I know that the untagged antenna is 20 but if another one loses its tag I'll be down to comparing lengths of loading coils...

What methods can folks suggest for labeling these antennas? Remember that, while in use, it'll be exposed to the elements on the rear bumper of a car.

You can connect several resistors in a series-parallel combo to get higher wattage while keeping the 50 ohm resistance. There is a limit as a non-resistive complex impedance will grow larger as you add more resistors due to stray inductance and capacitance. House the resistors in a small can and fill the can with mineral oil. This will increase the wattage rating. In fact resistors submerged in oil will handle 10-20 times their wattage rating for short periods. Paint the outside of the can black to increase radiative cooling.
(Ever see a Heath Cantenna?)

Hint: get 10 120 ohm 2 watt resistors, and connect them in series-parallel. (IE: 5 sets of 2 series connected resistors in parallel). This will give you a 48 ohm 20 watt resistor. With the resistors heat sinked in oil they will handle 200-400 watts for short periods.

At the time "CB" in the 27mhz region made sense because UHF equipment
was too expensive to build for the masses. That's no longer true. The
FCC should eliminate the 27 mhz CB service before the start of the next
sunspot cycle and force everyone there to move to UHF. One of CB's
biggest problems was interference from 'skip' (DX), and it is illegal to
work DX stations anyway.

I have to break down the antenna to fit in my trunk. I mark the whip with colored vinyl tape at the point it adjusts into the mast, and put a piece of the same colored tape on the mast. Red=40, Blue=30, Yellow=20. I use Hustlers for 75/80 since the Hamstick doesn't cover 80, and the 75 meter resonator carries red tape so I can quickly tell it from 80.

I have a Racal-Dana F64 function generator that I'm trying to repair
for a friend. It has the ability to function as a frequency counter
for an external input, this appears to work without difficulty. I have
not, however, been able to make it generate a signal. When switched to
input, the frequency display reads zero. Does anyone know where I can
a schematic for this machine? Any help is greatly appreciated.

Heatshrink tubing. Either colour coded, or clear with a printed/coded label
inside.

How about labelling the antenna or base with a self-adhesive label
(e.g Brother P-Touch), and then covering it with some clear
heat-shrink tubing?

Thank you,
Mike Knowlton

So I think I did something wrong, I check your email and copy
RadioShack.com Order Center/helpdesk
from your email, add www. and of course, there is no such page.
Ok, so I try just www.radioshack.com and look for Order Center/helpdesk
I don't find Order Center/helpdesk anywhere on the page.
After much searching I gave up.
I located an 800 # and called it, After pushing all the right buttons, hey

guess what? I get a busy signal!
The next call, I'm very quiet, I don't say anything to all the prompts,
finally a live person answered and I get switched to someone that
helps me. You don't carry the repair part I needed, but I did get an answer,
it did take two emails and about 45 minutes, but I got an answer.

Your Valued Customer,
Mike Knowlton

Paint or nail polish with the resistor color code:

GRY/BLK = 80
PUR/GRN = 75
YEL/BLK = 40
ORN/BLK = 30
RED/BLK = 20
BRN/GRN = 15
BRN/BLK = 10

Since the hamsticks themselves are black, you could omit black as the second color unless you want to paint a white background first. I'd paint a circle clear around it like a resistor so you can read it without rotating the antenna.

And yes, there is green nail polish. :-)

I use standard return address labels under clear heat shrink (teflon) to label pressure transducers at work and it works just fine.

This has to stand up to hot ATF (Automatic Transmission Fluid) at about 100 deg.C.

P Touch labels are thermal and turn black with heat.

I've been using nail polish to mark the polarity of toriod coils. The
problem is, other than red/pink, most of the colors aren't very opaque.
Even though blue and fluorescent green look starkly diferent in the bottle,
if you paint them on something dark they are pretty hard to tell from clear.
Having the brush in the bottle is terribly convenient, though. Why don't
they make model enamel with the brush in the cap? Or nail polish that looks
like model paint?

Oh yeah, and nail polish has an amazing range of price. I have a few
bottles of the cheap stuff I got years ago. Might be more opaque if I could
get my head around ten bucks for a half-ounce of paint.

At a former job I had a rather over weight supervisor, and there was a crazy technician from Jamaica. The tech was always making rude comments about his overweight boss, so we had "the black calling the kettle pot".

Yeah, this was an unpleasant surprise last night. I'd bought the 75m antenna months ago & figured it was marketed as "75" because they didn't think anybody would want to work mobile in the CW band. Finally got around to trying it in a Wendy's parking lot in Cadiz, Ky. - and found with the stinger all the way out it wouldn't resonate any lower than 3650.

Yet the cutting guide packed with the antenna provides length settings for the entire 80m band.

Yes, I *was* parked far away from any light poles/buildings/semis/other detuning objects...

(and despite the >9:1 SWR I was able to make three QSOs on 3560 as far away as Pennsylvania...)

What is it about cities?

Here in MI, the Interstares move along quite nicely out away from the cities (well, except Friday night when everyone in the state goes "up north"), but get near Detroit or Grand Rapids or Kalamazoo and you better have your jet pack..

Amen brother! Not only do they have to go faster, but they HAVE to be in FRONT of you, no matter what!. I've been passed like I'm a dirty rag going in reverse and once they pass, then they get in front of me and slow down to exactly the same speed I am going when they pass me. That always makes a bunch of sense to me! Worse yet is when they pass you in town on a two lane road, get back into the lane in FRONT of you (again), go 2 blocks and then put on their LEFT blinker and now we BOTH have to wait for opposing traffic. I suspect THIS is the reason the concealed weapon laws have a hard time getting passed into law ('cause that sucker would be dead now) ;)

I like your reasoning, although realistically they'd have to have a
well-publicized program to do so that would most likely have various
"deadlines" that would get pushed back a few times before really having any
meaning (just as the switch to broadcast HDTV has done!) I'd expect that
equpiment manufacturers would -- for a time -- be building dual-band radios.

Given how "abused" FRS and GMRS are anyway, perhaps the FCC could just drop
the GMRS licensing requirement and pretty much be done with it!

I know you're right. Requiring good operators will kill the service.

Hams just want to be appliance operators these days and they don't want
license exams that will interfere with them getting to those appliances
even though it means being less skilled. I don't see anyone modernizing
like everyone says is happening. They just get their licenses and grab a
microphone. What percentage of hams have a computer connected to a
radio? Probably less than 30%. Hams don't want to modernize. Guess we
just have live with inferior operators on the bands from here on out.
Then again, maybe hams shouldn't be required to be knowledgable or have
skills. Requiring skills and knowledge is too old skool. Everything must
be outcome based these days, even licensing. It ain't like we have to
help out in emergencies or anything. It's Quantity, not quality. We need
more hams even if they aren't skilled.

> vk3bki

Pwr supply is similar in all: Tektronix 2213/2215/2213A. bama.sbc.edu
as a starting point for free download.

check postings of Jim Yanik and others in sci.electronics.* for this
type of fault.

This type of Tektronix scope has an SMPS with a primary pre-req
circuit. Faults, repair hints and corrections are often described in
e.g. sci.electronics.repair and similar.

Most often: TL597 IC blown, FET blown, fast recorvery diode blown.

hth,
Andreas

Sure, it's done quite a bit to increase the inductance. The fly in your soup is trying to keep the ferrite material from Saturation.

If you like the subject of rf (and audio) amplifiers you might consider joining the yahoo rf amplifiers group:

http://groups.yahoo.com/group/rfamplifiers/

Well over 800 members and we talk about all things rf amplifier related but not limited to.

Hope to see you there...

cheers,
skipp

Many amps produced today use ferrite in the tank (usually toroids) for 160/80 meters... This is done to keep the physical size of the tank compartment minimized... Skipp has pointed out the drawback... You cannot saturate an air coil...

---------- REPLY FOLLOWS ----------

I could be wrong, but I don't think you will find ferrite coils in the tank circuit of any commercially built amps. Powdered iron is preferred for resonant circuits because it will not saturate at any reasonable power level, unlike ferrites.

You will find ferrites in non resonant circuits such as filament or heater chokes.

Wouldn't that also drastically reduce the Q of the tank?

Seems to me your time would be better spent on things with lasting value.

Linux is free. You can boot directly off the CD image. CD drives are less than $20 new; likely free for the asking from the dead PC junk heap. Any pre-built kernel less than 5 years old will work with most NICs, PC filesystems, and CD drives. Total time and cost can be less than the kW-hrs you already burned musing about parallel port transfers.

Hi, I'm looking for a Collins 30L-1 Round Emblem, High Frequency, Linear Amplifer. Not looking for any junk, actually I want one in excellent condition, Must be Round Emblem... Prefer one that has already been refurbished, things such as power supply, caps , etc...So as I do not have to do it...Although I've restored a few of them...I just want one in Excellent to Mint Condition...
If anyone out there has one of these amps, please feel free to e-mail me and if you like call 718-331-7427

Thanks a Lot

If the preceding stage is clean, does it matter? The main point of the tank is impedance matching. If the stage before isn't too clean it can also double as a filter, but if the input to the tank is pretty clean, then the Q doesn't really matter all that much. Indeed, lower Q is an advantage in terms of being able to operate across the band without retuning.

What you say is true only for class A operation. In any other class,
the plate tank acts as a "flywheel" to provide the missing portion of
the RF cycle, and in that application, Q is important. If the Q is too
low, the "flywheel" runs out of energy and severe distortion can
result. A Q of at least 10 is recommended for that reason, and Q's of
12-15 are often used for better harmonic suppression. Q's above about
20 are a bit much and can lead to excessive heating of the tank coil
and a narrow tuning bandwidth, but are otherwise pretty much harmless.

Linux may be free, but the aftermath of installing Linux would cost
YEARS of effort to "port" the:
801 FORTRAN programs I currently use
225 Pascal programs I currently use
452 DOS .BAT and Norton's DOS .BTM scripts I currently use.

No, converting to Linux is NOT free, especially at my age!

>Simply using google to find a laplink parallel cable is quick, too.
>http://www.nullmodem.com/LapLink.htm

Of course, even LapLink's "parallel" cable only transfers 4 bits
at a time vs. the 8-bits that are possible on an EPP port.

And LapLink does NOT run in the background (as does RIFS - Remote
Installable File Server, which, alas, uses a serial port and is
thus also much slower than a fully parallel port.)

I find it interesting: lots of people have suggested I do something
ELSE, but no one has answered the question itself. Obviously I
posted my question in the wrong newsgroups! Oh, well; nothing
ventured, nothing gained (and only a little time lost).

NICs work fine in DOS. At least back with Windows NT (and probably still 2000... possibly not XP anymore though) you could tell it to build you a "DOS startup disk" which configured most everything you needed to connect to a NetBEUI-based server (which is still supported in XP, etc.). Many network cards still come with DOS drivers, and of those that don't, many really cheap ones are still "NE2000 compatible" and generic drivers can be found. I'm sure you can Google for the details -- I haven't done this in a number of years, but very commonly what I used to do was make DOS network startup disks so that I could connect to a server to pull over a complete hard drive image to set up the machine using, e.g., Norton Ghost.

There's a very good chance the vast majority of your programs would work under WINE in Linux. That being said, Linux -- especially with the "popular" desktops such as KDE -- has gotten to the point of requiring powerful enough hardware that, if your PCs wouldn't "comfortably" run at least Windows 2000, you probably shouldn't bother with Linux as you probably won't have a pleasant experience if you just perform a "default" install of any contemporary distributions.

You might be better off in one of the "historical" computer groups (maybe alt.folklore.computers); what you're wanting to do requires knowledge that's simply obsolete by current standards, so you won't find that many people who still possess it.

5366. Re: How connect two EPP ports to "talk" between them?

Source record: 9517

I did this back in 1984 when I got a Toshiba portable with the new 3"
floppies, just to get files back and forth.
Later somebody made some commercial products (pdq, lablink, ...)

In short I did:

Server end is a program that reads requeste from other pc, and reads or
writes disk sectors.

Client side has a device driver, disk type, so I now has a D: on that
computer.
I took the memdisk example from the tech books, and rewrote the read and
write sectors to go to other computer.

It works very nice. Only trashed a few disks when doing small
programming mistakes ;-)

Now the interface between the pc's, which first was tested for function
of rx/tx, like Send512Bytes(SomeData)

I had the old parallelport, so I had 5 bits and used 4 for data and 1
for strobe.
I did not use interrupts, as the server just sat there waiting for the
other end to start flipping the strobe bit.

```
Procedure SendHalfByte(Strobe,B: Byte);
begin
Port():= Strobe+ (B and $0F);
SleepShort;
Port():= (1 xor Strobe)+ (B and $0F);
SleepShort;
end;
```

```
Procedure Send1Byte(B: Byte);
begin
SendHalfByte($00,B);
SendHalfByte($80,B shr 4);
end;
```

The receiver end will do

```
Function Read1Byte: Byte;
var X: Byte;
begin
repeat until StrobeBit<>0;
X:=Port() and $0F;
repeat until StrobeBit=0;
```

```
Result:=X + (Port() shl 4);
end;
```

Use Send1Byte and Read1Byte, and you have data. Make some framing like
DataToSend:= LF + MyData + CR
and it is easy to check for correct reception.

I managed to put some 50KBytes between two PC's in 198x, at 8MHz I guess.

PS: All coding above is out of my head, and was done in assembler back then.

You asked how to connect tow parallel ports. The link gives two examples. The examples are ones that worked with commercial software. (Hint: that means they would probably work for you. It may also meet your criteria for reliability.)

>
> And LapLink does NOT run in the background (as does RIFS - Remote

Your original post made no mention of specific software being a restriction. It did say this was a one-off job without out a speed requirement.

>
> I find it interesting: lots of people have suggested I do something

Your fault the time was lost. Simple google searches would have given you what you wanted.

The search to find the earlier link was on "laplink parallel cable".

If you do a search on "connecting epp ports", one of the links will be this page.

http://www.lvr.com/jansfaq.htm

Scroll down to the bottom to see a problem with connecting all data bits. (You did say you wanted a reliable solution.)

Yes, this may have been the wrong newsgroup. That is not the fault of anyone who replied to you.

Wollongong. Beame and Whiteside. To name two.

But that's going backwards. With one foot in the grave already, you need to
keep moving forward, not back. If it runs DOS, it'll run Linux.

It boots off the CD. I know I mentioned that. It's worth mentioning a second
time. And a third: It boots off the CD. No installing, no configuring...
Just boot it, FTP your files, and get on with whatever it is you're trying
to do.

>
> No, converting to Linux is NOT free, especially at my age!

Yeah, I know just what you mean. About the age thing, that is. Time's
wasting; best get to it.

Maybe it was the wrong *question*. Kindly refrain from
criticizing a forum like this for not being your personal
research staff.

As the discussion showed, what you really want to do
is transfer files. Fine. If you want to transfer files, a null
modem cable (an off the shelf item) and a couple of
copies of kermit (ditto) will transfer a lot of data. I
transferred a Windows 95 CD to a laptop once that way.

That may be what the DISCUSSION showed, but that's NOT what my QUESTION
asked (which was how one might connect two EPP ports so they could "talk"
with each other bidirectionally).

Others "answered" the question by suggesting alternative solutions
(And there is/was nothing wrong with that!),
but only a very few actually addressed the original question,

And I hereby thank them.

Bill, there is a transmitter described in the 1967 ARRL handbook
that does indeed have a small piece of 1/2 dia ferrite rod (broken off a
BCB loop stick) inside the 80meter tank coil to decrease the number of
turns needed in the coil. This was a two tube transmitter using a 12by7
and a 1625. Plug in coils are used for the oscillator and final tank
circuits.

Sounds like there's some confusion here between "loaded O" and "unloaded Q".

Ferrite in the tank coil reduces the number of turns needed for a given coil inductance but it also reduces the "unloaded Q" of the COIL, increasing tuned circuit losses. The "loaded Q" of the CIRCUIT is primarily what determines bandwidth, and it is determined by the inductive reactance and the load impedance the coil is imbedded in. The inclusion of ferrite has little to do with "loaded Q" and thus little to do with the bandwidth of the circuit (at least for practical first-order considerations; small tuned circuit losses do have a small second-order effect on bandwidth).

When reducing the number of turns, the resistive losses would go down,
especially if a thicker wire can be used in the same space. Does the
ferrite core losses _always_ increase faster than the coil resistive
losses are reduced ?

> Not sure I agree with that. What about losses? Lower Q means higher
> losses...

Loss is related to the ratio of unloaded Q to loaded Q. All else being equal, lowering the unloaded Q will increase loss, but lowering the loaded Q will decrease loss. As others have posted, the unloaded Q is a characteristic of the tank circuit itself, usually primarily the inductor; loaded Q is largely dictated by the external load and how it's coupled to the tank. Hence the tendency to keep the inductor Q high but not make the loaded Q any higher than necessary for harmonic and spur reduction.

I'm not certain to which group I should post this question, so I'm shot gunning hoping to find it. If anyone can point me, please do. However.... Has anyone used the HP 3582A audio spectrum analyzer to plot the freq response of audio devices like mikes, speakers, etc. Knowing the mike response I'd like to see the spectrum of plucked guitar strings and their harmonics and see how different manufacturers sound varies in a plot. I got a 3582A at a swap meet, its complex and probably overkill but that's what I have and I am anxious to try it out and would appreciate any tips.
Thanks

The 3582A is just one of many two-channel FFT analyzers which can be used
to measure the frequency response of a system (output re input). What
specifically is your question? Perhaps all you need is to get an operating
manual and learn how to use it?

Spectrum analyzers do a whole lot better with continuous signals than
they do with a plucked guitar string, unless you can capture the audio
and analyze it digitally. If it is an actual FFT that you can use and
you got it cheap enough you may have made a killing in the instrument
department. Why I go to flea markets and especially estate sales where
the widow is running it. About 3 months ago I bought some 30 year old
equipment, brand new in the box from a widow who just wanted to find a
good home for her departed husband's "junk". Tektronix used to have plug
ins for their line of scopes to do just about anything so if you can't
master what you have, check E-bay.

I've done this, some years back, with much more primitive gear. and
found that the spectrum of a plucked guitar string varies with time;
ditto for the natural and left-hand-stopped harmonics. If you listen
closely, you can _hear_ the variation: the higher frequencies die much
more quickly.

I'm not sure of the physical mechanisms that are involved, but suspect
that they include the nonlinearities in the strings, the woods. The
shape of the soundbox probably has a strong influence as well, or so I
think. I would not be at all amazed to find that this holds true for
plucked chordophones in general.

I would expect the spectrum of a continuously-driven string -- a bowed
string, such as a violin, viola, violoncello, viol, or vielle string,
OTOH -- to have a spectrum that was closer to time-invariant, once
the string got up to constant amplitude and as long as the bowing
continued. A hurdy-gurdy wheel is the ideal here, since it acts as a
bow as long as it is being turned.

But you're wanting the response of a plucked string, not that of a
bowed string. I suppose you could try two different approaches. One of
them would be to build a rotating-wheel bowing machine to look at the
spectra of strings continuously-bowed with different speeds, at
various distances from the bridge, and at different pressures. Another
would be to build a mechanical string-plucker, so that you could get
consistent values of plucking force, while (again) varying force,
distance from the bridge, and so on.

An advantage of the mechanical plucking machine would be that you
would (should, in a perfect world) be able to use the output of
multiple runs where all the variables were the same, and that you
could build some very nice "3-d" plots to show the variation in
spectra as the distance from the bridge (or the force, or some other
variable) changed.

Still, it is an interesting project -- the more so to me since I've
been a classical guitarist for 49 years, and learned that strings from
different manufacturers, and even different styles of string from the
same manufacturer, can sound *very* different on the same instrument.
That was why Segovia standardized on Augustine strings -- or so he
told us one night, at a meeting of the Houston Classical Guitar
Society, back around 1965.

Unfortunately, the same strings can sound very different on two or
three different instruments, too. None of this is in any way easy.

This probably would get a fair amount of interest in, say,
rec.music.makers.

Posted to, and followups set to, rec.radio.amateur.homebrew, where
I read it.

Another option, FWIW, is to use the PC to capture and analyze. The audible spectrum would seem to be quite unchallenging for common desktops. Compression schemes such as MP3 and WMA, after all, operate on the frequency domain. In fact, Windows Media Player delivers the FFT stream to visualization modules. There's likely free software somewhere that can do what you're looking to do. OTOH, you then have the soundcard's non-linearities to deal with, which is likely not on par with lab or even studio grade equipment.

There are studio grade PC audio interfaces, and some are among the
highest-performing audio components around. Some are on a par with the very
best lab equipment.

There is free PC software called RMAA that will automatically conduct a
representative suite of audio tests, and produce reports in a few minutes:

Yes, lots of people have used HP FFT analyzers for all kinds of things.
There isn't a lot of trickery... they pretty much work.

One thing which you can do with these older analyzers is measure much higher voltages than possible on a sound card FFT, much lower frequencies -- they were used for vibration analysis as well as audio -- they are also very well isolated -- you can find a repro of the manual on EBay for ten bucks.

Easy enough to address. I use a 5K RN50 potentiomenter for the purpose. If I want an accurate voltage measurement of audio, I use a voltmeter.

> much lower frequencies -- they were used for
> vibration analysis as well as audio

Not much difference between most vibrations and what a subwoofer does. If an audio interface is flat within 0.1 dB at 20 Hz, then it is pretty good an octave or two below that!

> -- they are also very well isolated

There is this amazingly good audio isolation transformer at Radio Shack. Sells for under $20 a pair...

> -- you can find a repro of the manual on EBay for ten bucks.

You can find an audio interface that will outperform say a HP 334 for $30. For $200 you're in the same league as some of the older, but not all that old AP stuff.

Actually, pretty much any modern PC audio card will have plenty low enough distortion for the application, and quite likely better than the HP3582. The 3582, is, after all, quite an old instrument. The advent of digital audio changed the whole playing field for audio range ADCs and DACs, as well as support parts like op amps (though codecs as used in most inexpensive PC audio systems don't need additional preams on their inputs anyway). Frequency response at the low end can be an issue; there are many vibrations that are too low in frequency for a sound card to deal with. Think "seismic" and you'll understand. The AC coupling in the HP E1433 is programmable to very low frequencies, as it's actually a feedback control system run through the DSP following the ADC, but most AC coupling will have a 3dB corner frequency around 1Hz, or higher if it's really just for audio. Sound cards may well use codecs whose ADCs have digital AC coupling, as well, and the card may not provide a way to turn that off.

Another package that can be used to do FFTs on captured audio, and to otherwise manipulate the audio file, is the free Scilab package. You can play to your heart's content with math functions on the audio (or on pretty much anything else you can represent numerically), but of course you can get yourself into trouble if you don't understand what you're doing. And along those lines, I'd strongly caution you to not

read too much into what Scott wrote, "Yes, lots of people have used HP FFT analyzers for all kinds of things.
There isn't a lot of trickery... they pretty much work." The _analyzers_ may work, but if you don't understand what they do, you may make very bad measurements with them, and you may badly misinterpret the results you see. There are, I believe, HP/Agilent ap notes on making _good_ measurements and properly interpreting the results.
Well, I KNOW there are, though finding them on the web may be a bit of a challenge.

Cheers,
Tom

Hi- there is a HP newsgroup on Yahoo, try that. Jim.

5401. Tapped capacitor tanks

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-20 21:54:09 UTC
From: Joel Kolstad <JKolstad71HatesSpam@yahoo.com>
Message-ID: <12m4902i6dq8t15@corp.supernews.com>
Source record: 9552

I've been playing with oscillators a bit here, and I wanted to ask if the way I'm intuitively thinking about the operation of a tapped capacitor tank is the way other people do:

Say we have an inductor L in parallel with tapped capacitors, C1 and C2. If the loaded Q of the tank is reasonably high (say, >10 -- which you'd want for any decent oscillator anyway), we can pretty much ignore the "input" and "output" of the tank, as their effect on what happens within the tank isn't significant. As such, we can just look at the current circulating around the tank, and from the "top" of the tank to the "bottom" you get 90 degrees phase shift going from C1 to ground and then another 90 degrees from ground through C2. Hence, from the top to the bottom you have 180 degrees of phase shift, with the values (ratios) of C1/C2 just setting the magnitude of the output voltage vs. the input. Sound good?

I started going through the math involved and determined that you can readily confuse yourself if you don't make the "high Q" assumption. For instance, something like a 1 ohm source and 1 ohm load feeding a tank of 159.2mH (j1 ohms) and 2 318.3mF caps (-j/2 ohms) has such a horribly low Q that there isn't a 180 degree phase shift top to bottom, nor is the resonant frequency 1Hz.

Thanks,
---Joel Kolstad

Sorry, no. EH antenna inventors and apologists notwithstanding, the
phase of current doesn't change as it goes through a capacitor.

Hi Roy,

"Roy Lewallen" <w7el@eznec.com> wrote in message
news:12m4eicmqlfjjdc@corp.supernews.com...
> Sorry, no. EH antenna inventors and apologists notwithstanding, the phase of
> current doesn't change as it goes through a capacitor.

Agreed. I'm being rather loose in my terminology here, what I mean by "you get 90 degrees of phase shift going through the capacitor" is that the voltage across the capacitor ends up (must be) 90 degrees out of phase with respect to the reference current as you consider the capacitor's effect.

You don't disagree that the voltage at the top of a tapped capacitor L-C tank is 180 degrees out of phase what that at the bottom at resonance, do you?

5408. Intersil CA3162E/CA3161E A/D BCD/7Segment problem Weller Soldering Station

Newsgroup: rec.radio.amateur.homebrew

Subject: Intersil CA3162E/CA3161E A/D BCD/7Segment problem Weller Soldering Station

Hi
I am trying to fil my Weller soldering station which has lost its temperature readout. This particular model has the Intersil CA3162E/CA3161E A/D and BCD/7Segment chips. When first turned on the display flashes "EEE" and then goes blank. I shotgunned the repair by replacing the filter caps in the power supply and though I had it fixed but it is back to same problem.

In reading the Intersil application notes for the A/D convertor I don't see a logical mode where EEE would be displayed

Does anyone have advice for troubleshooting this configuration?

my terminology here, what I mean by "you
> get 90 degrees of phase shift going through the capacitor" is that the voltage
> across the capacitor ends up (must be) 90 degrees out of phase with respect to
> the reference current as you consider the capacitor's effect.
>
> You don't disagree that the voltage at the top of a tapped capacitor L-C tank
> is 180 degrees out of phase what that at the bottom at resonance, do you?
>
> ---Joel

Joel, what do you mean by "at the top" and "at the bottom"? Voltage
measured with respect to what point? Clearly, if there is the same
current through two capacitors in series, the voltages across each of
them must be in phase, so the total voltage across the two is the
simple arithmetic sum of the voltage across each. That assumes that
they are ideal capacitors, but practical ones will come close. On the
other hand, the currents in the two may not be exactly in phase, as you
perhaps discovered with your low-Q tank. If the current at the node
between the capacitors is contributed to by some external load or
source, and if that additional current is not small compared with the
tank's circulating current, then the capacitor currents may not be in
phase, and the voltages then would also not be in phase, and you'd need
to add them vectorially to get the right result.

Of course, Spice will simulate all this for you very nicely, using
either a transient analysis, or a frequency-domain analysis if all the
parts can be assumed to behave linearly.

Cheers,
Tom

Joe -

Which model are you trying to repair? EC 2002M ?

Positive your handpiece is okay? (Type-K thermocouple can go bad)

Bob Wurth just happens to have replacement control board
on eBay -- item number: 270057328135

reasonable price

It is an EC2002A from way back. A nice clean unit except for the display problem. I dug into it this weekend hoping it was just a bad capacitor in the PS. It did start to work for a short time. There are numerous potentiometers in the thing, its possible one is intermittent.

Andy writes
I'll second that. J , try your ideas out on SPICE. Try to figure
out
what it will do before you simulate it, and then use the simulation to
check your conclusions..... I've found it to be invaluable in
straightening
me out on some of the ways I "thought" nature worked, and in getting
a lot of things straight.....

Same with EZNEC, if you have it..... I learned a lot more about
how
antennae really work from EZNEC than in 30 years of cutting wires and
hooking up SWR meters......

Simulators are wonderful things. And no one has to know about the
times one turns out to be wrr...wrrro....wr.r..........
imprecise....

Made an inductance meter based on a resonant LC circuit and used a PIC to
back calculate the inductance and Q values based on known F and C and
currents. Circuit was able to work down to Q values of <1 at frequencies
down to 5Hz. Worked well.
Did the programming and found it just wouldn't calculate the correct L
values when working at low Q. Spent hours doing tests until it dawned on me
that I'd stupidly programmed in the "standard" resonance formula.
Suddenly became sweetness and light when I reprogrammed for ...
Frequency= 1/2*pi * sqrt(1/LC -R^2/L^2).
I continue to live and learn :)

Ya know, I built an 80/40 similar transmitter back in 1960 and used a chunk of ferrite from a BC radio loop antenna inside the 80 coil form to resonate it on 80 meters - the ferrite was moved around until the tank made the best power out on an RF ammeter then it was glued in that position... A tube VTVM from Heathkit was used to help build the transmitter - and the kit SWL receiver from Lafayette Radio which received the entire ham band with the dial at one setting :)
Lots of bean soup and 'day old' bread from the bakery...Good memories...

I think that is why I subconciously posted the word ferrite when commenting about the current trend to toroids in the tank circuit...

I probably have a ceramic based board of that era around in my Weller parts.

A local distributor just cleared out his inventory on eBay of Weller boards of that era. I think I posted most of my schematics and Tech Sheets I had in stock --

---------- REPLY FOLLOWS ----------

It isn't a question of "Q", it's a question of whether the ferrite
goes into saturation on current peaks. If it does not, then all is ok
but if it does, severe distortion of the RF waveform will occur and
harmonic generation will be excessive. Powdered iron is a much better
choice for this application.

5422. HD Radio on an Analog Receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-22 18:57:00 UTC
From: Al Lorona <al_lorona@agilent.com>
Message-ID: <1164221004.219572@newsreg.cos.agilent.com>
Source record: 9573

Hi, Everybody,

Over the past couple of years several AM broadcast stations in the L.A. area have begun transmitting the new "HD Radio" signal. A "high quality" digital signal is superimposed on the standard AM signal and so the station can be received with either type of receiver. I believe there are about ten stations now doing this here in L.A. and probably everywhere else in the country.

Have you tried this?: Tune in a local HD AM broadcast station on your general coverage receiver in SSB mode, either USB or LSB. When you zero beat the station you will hear a loud rushing noise floor behind the program audio. This morning, Rush Limbaugh and Dan Patrick sounded like they were each doing their shows from in front of Niagara Falls.

Even in AM mode, as you approach the station from either direction you'll hear a hideous broadband noise until you get onto channel center. It's really annoying and bad for AM DXing because of the interference (in the form of increased noise floor) these local stations cause to the weak DX ones on either side of them.

ANNOUNCING the SALE of INTERNATIONAL RADIO
http://www.qth.com/inrad/

George, W2VJN and Georgia are pleased to announce that effective January 1st, 2007 International Radio will be under new ownership. We wish to thank our many customers for their business and friendship over the almost ten years we have owned this company. We have learned much and worked hard, and it has all been good, but it is time for us to look ahead.

International Radio will be in the very capable hands of new owners Trey, N5KO, and Mark, AG9A. Trey and Mark are dedicated radio amateurs who appreciate all aspects of this hobby - especially contesting! They have ideas for the future, and they will not only sustain Inrad; they will improve it. We look forward to helping them succeed in any way we can. In particular, George will stay involved in the development of new products.

For more than two years we have been assisted by Laurie, our employee extraordinaire. Many of you know her and we know you join us in thanking her for her hard work and dedication. We will keep her as a valued friend.

Our final day in business will be December 15th, 2006. International Radio will then be CLOSED until January 1st, 2007. Online orders will be gladly accepted during this time and fulfilled when we reopen in January. Watch the website for the announcement of the annual New Year's Day Sale.

George, W2VJN

>Joe
>W3JDR

------------ REPLY FOLLOWS ------------

If you go clear back to the original question you will see this:

" Many amps produced today use ferrite in the tank (usually toroids)
for 160/80 meters..."

My response was that the toroids were almost certainly powdered iron,
not ferrite. All the stuff about Q and bandwidth came much later. I
stand by my original statement: powdered iron, not ferrite, and the
reasons have EVERYTHING to do with distortion.

Bill, W6WRT

Pete
I saw it and got it several days ago but I sure can't make the thing work
like a spectrrum analyzer. And I know how to use a HP 141T and its plugins!
I don't think there's anything wrong with it as it behaves per the manual
Any other help appreciated. Perhaps someone has used one for music study as
I want to.

5436. 5 Radio Frequency Interference Ferrite (RFI) Reducers for Round Cables

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-23 18:09:53 UTC
From: muldawer@gmail.com
Message-ID: <1164305393.592161.319420@k70g2000cwa.googlegroups.com>
Source record: 9587

5 Radio Frequency Interference Ferrite (RFI) Reducers for Round Cables

Cut down on RFI (radio frequency interference) with this effective and easy to use clamp-type split ferrite choke core. Simply snap it over any coax cable, AC or audio cord.

Features/Specifications: Split ferrite RFI reducer for round cables
Clamp-type fitting
Uses high-performance ferrites (Nickel-Zinc) that reduce high frequency noise
Split ferrite assembly are fully enclosed in a Nylon case
Can be installed before or after product setup and assembly

Package Includes: RFI reducer for round cables

Product Requirements:
Suitable round cable

RFI filters can be pretty important when cables are run through big bundles of other cables or near strong power supplies. Put this RFI reducer on your round coax, AC, or audio cord to improve the signal quality. This Radio Frequency Interference Reducer is made with high-performance ferrites (Nickel-Zinc) to ensure a better filter process. It is small, only 1.2 inches long and snaps on in an instant. Here is a picture of the product in use:
http://64.70.175.67/images/FS/RFI/RFI2.jpg

$10.00 (shipping inc.) I accept Paypal!

Hi Hank,

This unit should operate like any other spectrum analyzer. Make sure that
you have it for recursive operation. This button is just above the "ARM"
button.
It took me a little while to figure mine out too.

A lot of liberals and retards have me killfiled already. I won't truely
be happy until I'm in your killfile too, then I think we'll have about all
of the liberals and retards covered and I won't have to worry about seeing
retarded follow-ups.

Andy writes:
Jeff, I haven't tried this method, but one rule of thumb I have
always
believed in is:
~~~~~~

"No matter how much you shift, limit, amplify or divide noise, it still
ends up as noise"

The only effective way I have ever found is to narrow the bandwidth
around the signal until the signal starts to get degraded. If done
digitally, it can be done by digital processing, but that changes only
the technique, not the principle...

So, while I would really like to try out some of these "improved
methods",
I am not confident enough in them to spend a weekend wiring together
some hardware.... In my younger years, I probly would've, tho....

Personally, as a CW operator of some 45 years, I have found that my
ears/brain does a lot better job of filtering than one would suppose,
especially
if I am copying some standard message where I sort of know the words
the other fellow will send. I only need 2 or 3 letters per word to
fill in
the pieces with devastating accuracy (grin).....

But, good luck on your efforts. If you do build up something, please

come back and post it here. I am sure that there are many
experimenters who try something like that if someone thinks it shows
promise..... But, please, take some actual measurements. And with
S/N ratios of around the 0 db level. My ear copy can still pick those

out, and many of the "processors" can't deal with noisy sigs in that
region....they tend to fall apart when anything below tangential
sensitivity is received....

Actually, digital processing CAN change the principle.

FIR filters and similar digital filters do provide a way to reduce the bandwidth digitally, and as you point out, reducing the bandwidth reduces the noise. This helps the same way a crystal filter helps, except perhaps giving a little more flexibility.

However, many modern radios have digital noise reduction which is quite a different animal. With digital noise reduction, the incoming signal is analyzed to identify noise components and differentiate them from signal components. The noise is then subtracted from the signal. While this isn't perfect, it can result in quite a substantial reduction in noise without reducing bandwidth.

The combination of bandwidth reduction and digital noise reduction can greatly improve readability.

I agree that other typical analog techniques don't really affect things all that much, but I'm not convinced that the same techniques that are used for noise reduction digitally couldn't be duplicated with analog components; I've just never seen it done, and without some considerable creativity on the part of the designer it will be quite complex.

One analog behavior I have noticed that helps, at least with CW. For passive balanced mixers, there is a diode threshold voltage required for the signal to be detected. If the gain is managed so that the noise level is very close to this threshold, the signal to noise ratio seems to be improved (although I have not personally validated this analytically). Of course, if the signal is at the noise level this doesn't help, and if the signal is barely above the noise level the adjustment is too critical to be a great help, but where the signal has enough headroom, it can pretty dramatically

improve the pleasure of listening to a weak signal.

GAWD, These kids nowadays have it made!
Check out this kewl hotwheels radar gun on sale for $20.00 at Walmart.
I wonder if it's accurate though, I might just pick one up and
dissect it!!
Anyone already get one of these, is it accurate? TIA

Joe -

I went to my files and found the EC3000/EC4000 Tech Sheet (I have not yet
posted this one).
This model had the slide switch between READ and SET.

It shows an ICL 7137 as the main display IC and a MOG 2374 as the control
board IC.

The resistor values on the display board are critical for proper F readings

Double check the voltage on the secondary of your transformer. Red 24 VAC, Blue 9 VAC and Yellow - Common. On SOME models, like the EC3000 and EC4000 series a 1 ohm resistor is placed in series with the BLUE wire usually just inside the transformer (wrap/solder joint with wire lead).

I did have one -- where that resistor "opened" -- that caused similar problems. The 9 VAC feeds both the +5 and -5 VDC voltages using 1N4004 diodes and 3.9 Kohm dropping resistor on negative 5 and 7805 for positive 5 VDC.

And how high can it record speed? I'd like to try and nail a few
pimple-faced, pill-popping, high school dropouts who thinks 25MPH
speed limit means it's OK to rip down the road at 75. If it's
accurate enough, a video camera recording the speed and the offending
vehicle with its license place would stop them hopefully before they
get a new hood ornament in the form of a 3 year old child.

Very easy to build a gunn diode oscillator and scare the pants off
leadfoot at a 5+ mile range.

You need a gunn diode, 8 volt regulated supply, one small bypass cap
and copper end cap pipe fitting and piece of copper/ and some brass
screws to make a mount for the diode.

If you have an old radar detector with good gunn oscillator it can
also make a good X band source for triggering radar detectors - just
isolate the diode/horn sub assembly (you don't need the other parts
just the gunn diode, cavity, bypass cap and power supply). Tune the
cavity screws for maximum effect.

A video camera with on screen timer and known distance markers could
do the same thing - poor man's Vascar system . . .

Then you'd only have to fight the bureaucracy to make a citizens
arrest stick . . . or just convince the local TV station to take up
your cause - that would probably be a lot easier than dealing directly
with government.

Nope, it does "real speed" the amazon review says;

Amazon.com Review
Ever wonder just how fast you get your favorite Hot Wheels car to go? Or how speedy you are on your own bike? You donï¿½t need to be pulled over by a cop to find out. The Hot Wheels Radar Gun does the job for you, using all sorts of state-of-the-art technology. Just set the scale to 1/64th or real speed, and MPH or KPH, aim the gun at objects coming toward you or moving away, squeeze the trigger, and check out the digital readout. Simple as that! Now you can set new speed goals, and actually find out if youï¿½ve attained them. The 1/64th scale speed reflects the fact that Hot Wheels cars are 1/64th the size of a real car. So if a Hot Wheels car goes 10 MPH, the calculation is 10 MPH X 64 = 640 MPH! Now we begin to understand why those wheels are so hot! Requires four "AAA" batteries (not included).--Emilie Coulter

Product Description
Now you can read the speed of your favorite Hot Wheels racing vehicles. With point-and-read real-life styling and super-cool graphics. Not for use with some Hot Wheels vehicles. Requires 4 AAA batteries- not included.

I suspect its readout is scaled to Hotwheels scale, not
actual speed.

On the box it claims it does actual speeds up to 100 MPH. It's a hot item on
EBAY, but you can get it cheaper at Walmart or Amazon, the sell it on ebay! ;)

Interesting. Someone must be out there flogging a set of components
for radar guns. I bought a Bushnell one for measuring baseball speed
for < $100 not too long ago. It seems to agree fairly well (within a
couple MPH) with the professional models.

Best regards,
Spehro Pefhany

Unit operates on 10.525 Ghz and has a range of 39 (Thirty Nine) Feet....

Now for the laugh of the day. I was in the local Office Depot and saw a
pair of GMRS/FRS Ht's on the shelf. The package claimed 14 (Fourteen)
Miles range on GMRS High Power....

That is correct! It uses a 10.525GHz DRO circuitry.
Someone took it apart and posted the photos on the web.

Hmmm... since it is the same as x-band, I wonder if I used those on
freeway, maybe I could scare a few lead foots who has radar detector?
Say I'm coasting down the expressway at posted speed limit when
someone zips past me as if the driver's pants were on fire. Pick up
the toy gun and zap the offending car. If the driver has radar
detector on, he'd panic and slow down a bit.

Pete
Thanks for the tip on the ARM button now I'm getting closer to what I
know...
Next I've got figure out what all the FFT is about.

FYI
I just got my eBay CD with the ops and service manual and first glance tells
me that it has what I need. It's 202 pages and much more comprehensive than
the Agilent download and has examples on how to use it.
Thanks to all who tried to help me.

Can you be a bit more specific? I found a two-channel "Ground Loop
Isolator," #270-054. Is that what you're talking about? I didn't find
much else in the way of aurio isolation transformers there. From one
of the reviews, it sounds like the frequency response may not be all
that good; there are no specs on the web site (that I could find) that
tell us what the response or distortion is.

Cheers,
Tom

Your CB radio not back from the repair shop so you got to attack real
radio operators? I knew you went for those "easy-to-burn-up' Cobra and
Galaxy brand appliances.

Oh, and I don't live in colorado, I'm ya alls next door neighbor.

Howdy Neighbor. Heee Heee Heeeeeeee!

I have a 430 and there is no power output. Receiver works fine. Don't know if it is the finals or the power management circuit. I have used the rig for several years and many hours of use. I was using Groton Electronics for repair but they went out of business. Does anyone know of a reliable place that will work on the Kenwood 430s.
Thanks

There is a TS-430 Yahoo group. Ask there. No power out can be caused by
many things, one of them is a bad connection easily fixed.

Geoff.

Yeah, but I bet that there are hundreds or thousands of times more parts sold on eBay than eHam & QTH combined... (and of course eBay isn't free) -- There's definite value in a large selection and easy search/sorting functionality.

If you look at the web page where they tore it apart, you'll see it's little more than a microwave transistor oscillator using a DRO, another transistor for the mix, and a PIC microcontroller for all the "smarts." The PCB itself is a pair of (planar) antennas for Tx and Rx.

Clever idea... I wouldn't be surprised if someone thought it up and realized they'd make a lot more money selling the design (and consulting on it) to toy copmanies than just publishing it in, e.g., QEX.

5493. need help with xmission line xformer

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-28 23:01:04 UTC
From: sdeyoreo@hotmail.com
Message-ID: <0oepm21bc3hsjo1io0n0ipru5724bf63h0@4ax.com>
Source record: 9494

I work in a screening lab and have these 1:1 xmission line xformers:
http://www.futureelectronics.com/wirelessrf/docs/ETC1-1-13.pdf

I need to measure their insertion loss, per spec to 3 GHz. But I've never used one before and am not sure how to connect it.
I connected it as shown in this tutorial:
http://www.bytemark.com/products/tlttheory.htm
using an HP8753D in CW mode as a source and an HP power meter across the outputs as RL. Does that seems ok? I'm not sure about using the power meter across the output. Should I load one output and connect the power meter to the other, then measure insertion loss? Then switch load an p.m. and I would check amplitude balance also?

My problem is after "cal'ing out" my fixture, I get a bad dip in the insertion loss around 2GHz, like there's parallel C across the 'inductor' and it's resonating and opening up.

I made a short fixture on regular copper clad with 1/8inch wide traces for 50 ohm, short runs anyway, with SMAs in and out. Using the HP8753 in CW and a power meter, I took reference readings it with copper foil across where the DUT would be, then put in a DUT and took readings.

I have about 300 NOS from military surplus at 100K ohms, 3" shafts by CRL: body at 1.375" dia from the 1940's. I have opened and checked several of them and they all tested as marked. NO stains or rust- most are still in sealed packing. Wt is 2.5 oz sealed or 1.1 oz unpacked. Stock up while they are available. 1-10 ea $0.50 ea, 11-20 at $0.35 ea, 21- at $0.25 each. No 'handling' charges- you pay exact shipping only.

I also have some 1 meg with on-off switch and a few 5K coming soon.

Offered here before going to you-know-where.
Pse check my rating on Ebay for seller: heytubeguy

take a look at some of my other stuff while you are there: tnx

5498. Grounding crystal cases

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-30 00:22:51 UTC
From: Joel Kolstad <JKolstad71HatesSpam@yahoo.com>
Message-ID: <12ms92ses02ofa0@corp.supernews.com>
Source record: 9349

Anyone have an opinion on whether or not crystal cases (e.g., HC49, HC45, etc.) ought to be grounded or not? I've done some Googling, and I've found various cases where people recommend it (albeit without much explanation as to what they think will change when they do it) and no cases where it was specifically not recommended.

Thanks,
---Joel

Most of the time when I've seen crystal cases grounded it has been in
crystal filters, where it is supposed to help with feedthru.

I don't know. FT-243 crystal sockets had no means of grounding the crystal
case, which likely wouldn't have mattered since except for the metal access
side, they were bakelite. But it was pretty common to see a grounding
"spring" on HC6 crystal holders, at least those had metal cases. ANd it
seems more common to see metal cased crystals on circuit boards grounded
than not grounded.

Now, perhaps those springs on the old HC6 sockets were there more to
hold the crystal in place. But I always assumed that by grounding them
you'd stabilize the capacitance of the case to the rest of the crystal.
If you just leave the case ungrounded, then external things can affect
that capacitance.

Obviously the case affects the tuning of the crystal. I remember one
guy writing in CQ forty years ago where he'd open up HC6 crystals so he
could grind them on frequency, and he made the point that he couldn't
measure the new frequency accurately unless the case was back on at least
partially. Given that, if you ground the case you put things at a known
level.

If nothing else, grounding the case adds mechanical stability. WIth that
in mind, is there some reason you can come up with why you shouldn't ground
the case (trying to figure that out might help to figure out whether
they should be grounded).

5503. Radio designer software

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-30 03:30:00 UTC
From: Iitoi <Iitoi.2i2tpo@news.radiobanter.com>
Message-ID: <Iitoi.2i2tpo@news.radiobanter.com>
Source record: 9356

I have a copy of the old ARRL "Radio Designer" software, but it does not run on modern OS's, and ARRL has not renewed their agreement with the author.

Can anyone recommend a similarly capable software package which will run on an XP platform. Need not be freeware, but also cannot afford a professional 'commercial' package.

Suggestions?

I have the Windows XP on a 2004 Dell computer, and the Radio Designer program works perfectly. I have been using that program ever since it came out, no problem. Your difficulty can probably be fixed by the right technician.

I also have ARRL Designer running fine under Windows XP, on an HP Pavillion computer. However, I have had problems in the past with compatibility with certain video cards, especially under Win98.

For most solid-state oscillators it makes sense to ground.

For tube oscillators where the two pins to the crystal could be at high potential, it is probably better to not ground. In some Pierce or Modified Pierce oscillators you find either plate or screen potential; nominally this is supposed to be blocked by a ceramic capacitor (e.g. 0.001uF) in most designs but you'd be surprised how often this was left out!

Tim.

5510. Free PC Oscilloscope Software Preferences ?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-11-30 15:54:19 UTC
From: skavanagh72nospam@yahoo.ca

I am looking for a free oscilloscope program for the PC to run under Windows XP. Does anyone have any preferences ? It needs to be quasi-real....not just a toy, but it can be very simple. I have no need for spectrum analysis and single trace would suffice, but I do need a calibrated timebase, for example. So far what I have found does not meet my needs (time axis won't run slow enough, uncalibrated timebase, doesn't quite work properly on my computer....etc.).

Steve

What is bandwidth required? There is good 'winscope' available free
for
frequencies upto 20Khz.

LOL what? An oscilloscope is hardware, what are you gonna do with
software without hardware somewhere? What are you gonna scope with this
program????
I mean you can download a free logic analyzer program, but without the
hardware what's the use?
Here's a free software that lets you control an oscilloscope...
http://www.rigolna.com/support_download.aspx

So it's free, and then what??

Bandwidth required is whatever the sound card can provide....so 20 kHz
is fine. But the WINSCOPE I have found (by Konstantin Zeldovich) is
limited to a 50ms scan time. I want to measure time differences of up
to at least 100ms so this is not adequate.

But thanks for your suggestion.

Sound card !

> I mean you can download a free logic analyzer program

That could be useful in some circumstances....any suggestions as to good ones (that don't use serial ports as it has to run on a modern notebook) ?

Take a look at:

http://www.cleverscope.com/download/

They claim to have sound card support, so it might be worth a look.

I'd suggest trying out Ansoft SV,
http://www.ansoft.com/ansoftdesignersv/capabilities.cfm. I think one can make
a good argument it's -- by far -- the most powerful free RF simulation tool
out there. The user interface is a little odd, but only a little -- nowhere
near as different as, say, Eagle PCB is. There's a excellent tutorial for it
here:
http://www.elektronikschule.de/~krausg/Ansoft%20Designer%20SV/English%20Tutorial%20Version
/index_english.html
...by Gunthard Kraus.

There's also PUFF which... holy deja vu, Batman!... Gunthard Krauss has a page
on getting to work with Windows XP. Sayre's book, "Complete Wireless Design."
is almost the unofficial manual for it. It's nowhere near as powerful as
Ansoft, but you might want to try it out anyway; in its day it was really
quite good.

Amidon sells the Fair-Rite toroid 5977003801 as Core Number FT-240-77 @ $9 each. In an attempt to get a better price, I contacted Lodestone Pacific and was told that this particular item has a "grid" of 50 which means their minimum order quantity is 50. I don't mind ordering 10 toroids, but 50 toroids would last me several lifetimes. A company called Kreg Component also handles this item, but it is on back order. Any suggestions on where to buy this toroid at a better price than Amidon?

This has come up in the past, ever since the ARRL stopped selling the
software. Go to groups.google.com and do a search of this newsgroup using
<arrl "radio designer"> as the searchwords. You're at least going to find
discussion about alternatives after the ARRL version left the scene. It
was apparently a truncated version of some commercial software and at
one point at least there was a free student version of that commercial
software. Read the threads, and it may be helpful finding an alternative.
Though perhaps enough time has elapsed that the alternatives mentioned
have passed into history also, or don't run on recent operating systems.

It should not be impossible to get a 100$ FPGA board, generate a VGA display,
use a 100MHz flash DC and have 100MHz logic analiser / digital storage scope
for little more then that plus the price of the probe and a few discrete
components.
Like for example here:
http://www.fpga4fun.com/
http://www.fpga4fun.com/digitalscope.html

I would suggest "LTSpice" from Linear Technology. A freebie!

A full SPICE program that includes a schematic-capture option in
addition to the regular Netlist circuit entry. NO limitations on
number of parts. Some general-purpose models included in supplied
library. Runs fine on my XP Home operating system. Allows
printout of schematics, waveform-response displays from my system.

This SPICE derivative was originally supplied as a marketing aid
to demonstrate Linear's switched power-supply ICs...and apparently
someone at Linear had the bright idea to supply it as a freebie.
We can all benefit from that "marketing mistake" and enjoy a full-
on SPICE program.

I've already used it for a few months and find it matches the
commercially-packaged products from Intusoft and Orcad. Yes, it
does do oscillators without any need to add special components
to start one up. :-)

As with all SPICE derivatives, those not familiar with SPICE have
a learning curve that might be steep. By now, though, SPICE is
rather standardized and - usually - what is written about them in
the recent past will apply here. The schematic-capture drawing
function (converts automatically to a Netlist) is a bit clunky to
use but then so are the commercial programs that have that.

So far, the supplied models in LTSpice Library all seem to follow
the actual parts...such as with workhorse 2N3904 and 2N3906 and
1N4148 semiconductors, plus some others such as a few LEDs,
several standard zeners. Some of the inductors and capacitors
used with switching supplies are in the Library with reasonable
internal characteristics (ESR on electrolytics, DC resistance
and interwinding capacity on coils). One can add other SPICE
models with a supplied model-entry function but I've not tried

that yet...that be a prodigious side project. There's a couple of websites devoted to using LTSpice already on the 'web, one of those for modeling audio TUBE amplifiers.

www.linear.com Look in, about 5 MB FREE download.

Probably not if the tuning element is a DRO.

Bill

The DRO has a tuning slut above it. You might be able to tune off frequency by a
few MHz. The DRO puts out very little power <-30dBm might be a good idea to add
an amp from mini-circuit, smdi, rfmd or hittite microwave, you should be able to
get free samples from those companies. Another idea is to just get another puck
in place of the one in the cavity. free sample pucks are available at shf
microwave.

Also you might try trimming the cavity to give it more area thus decreasing the
frequency.
BTW, These guys sell pucks
http://www.morganelectroceramics.com/microwave/puck_resonators.htm

Yeah, but I have high speed. I can afford it. You, well now I understand why
you like CW so much. It goes well with the spark gap that you use...of
course most hams have real equipment, but you can only use what you can
kludge together with old beer cans and salvaged copper wire.

5534. Re: Radio designer software

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-01 02:05:28 UTC

Ansoft's Designer SV is available as a student feature-limited
download, and is the replacement for Serenade SV, upon which the ARRL
program was based. I DL'd the demo, and IMHO, it is not oriented
toward the HF RF market.

You won't find it onAnsoft'sr web site, but Serenade SV 8.5 is still
available. I sent Ansoft an email, explained that I would be using it
for amateur R&D/experimentation for the purpose of publishing in
amateur periodicals (which is true - QRP Quarterly), and they agreed
that if the Ansoft Designer SV did not meet my needs, they would try
to find a CD of Serenade SV and send it to me. In the meantime, doing
some serious Googling, I found a copy on a university web site, and I
used that. It runs fine on XP.

If you search the ARRL web site, you'll find some examples in the
January 2001 issue of QST that explored Serenade SV.

Good luck!

With respect to "what can you measure", do some searching on mixing RF signals down to baseband, for example, to look at 9 MHz crystal filter performance. There have been numerous threads on Yahoo groups lately on that, so you should be able to find some info.

Hmmm..now you have me thinking about what can be done with this "bush league" test equipment and a downconverter....I'm thinking perhaps two-tone intermodulation tests on RF amplifers....Cleverscope does have a spectrum analyzer....

OK
But good enough for me.

There's been quite a bit of discussion about the radar gun on the
Microwave mailing list, http://www.valinet.com/mailman/listinfo/microwave
and a bit on http://www.austech.info/showthread.php?t=135840

I ordered two.

John,

It's tough to find better pricing in low quantities. Considering that
even small toroids are at least $0.50, a big one like FT-240-77 for $9
doesn't seem out of line for 1~10 pcs. At least Amidon makes it possible
to buy in such small quantities. Another good supplier is Ocean State
Electronics (http://www.oselectronics.com) and their price is $8.75.

So, whatcha building anyway?

Yes, Amidon's price is fair, but if I can buy 10 of these large toroids for $6 rather than $10, I would probably bite.

These toroids are for use as common-mode filters for wires leading to/from electronic equipment. My ham rig operates primarily in the bands between 1.8 & 21.5 MHz.

You might want to check with electronic-surplus stores. Most of the ones around here have a fair supply of ferrite cylinders and toroids of various sizes (some pre-wound with wire, others bare). A lot of them appear to have been intended for power-supply filtering applications of one sort or another, and might be suitable for your needs.

Being that they're ferrite, there's little or no standardization in labelling or color coding (and many of them are "naked" ferrite with no coding at all) - you'd have to buy a few, and then run some inductance-vs.-frequency tests to see if you could figure out what sort of ferrite mix was used and whether its inductance and loss in your frequency range is acceptable.

It's a bit of a carp-shoot, but if you're lucky you might be able to pick up a bunch of usable ones (if not necessarily of the exact same size and mix you were thinking of) for rather less money... maybe as little as a dollar or two each.

Hmmm. As an example, I just checked one surplus dealer (www.mpja.com) and see that they have a Magnetics ferrite toroid, 1.9" OD, made by Magnetics, of a type "J" ferrite mix (permeability 5000), intended for EMI/RFI filtering (and for broadband transformers below 1 MHz). Data sheet for this mix can be found at

http://www.mag-inc.com/pdf/Ferrites/2006_Materials_J.pdf

MPJA sells these for $3.95 each in onesies, $2.95 if you want 20 or more. If those would do, you could buy 20 for the same $60 that you were hoping to be able to spend for ten of the Fair-Rite toroids.

Hi Alex, You sound like a brand new no-code Tech. Welcome to ham radio.

All those computers you mentioned will work fine, but if you really want to do any serious computer work you're going to want to invest in a Vic 20, or a TI-99, or a Commodore 64. Power users swear by'em.

I know what you mean Dan. With the anticipation that ham radio is going
to get dumbed down again real soon, the dumb-it-downers like Lenny,
Markie, Opus and a few others are really trashing the groups with anti
code test hate. We can only hope the code requirement is retained and
increased so that they can't get on HF and mess that up too.

No you don't. You're one of the foul-mouthed off-topic posters that
Dan is complaining about.

> With the anticipation that ham radio is going
> to get dumbed down again real soon, the dumb-it-downers

It got "dumbed-down" when a license was issued to you.

BTW, what is your call?

I second that! The VIC-20 is awesome (and easy to write machine
language programs for it). My first ham use for the VIC-20 was a CW
keyer program. I still have two VIC-20s and a C-64...

I wouldn't blame him for being ashamed of it, but for what it's worth,
his call is W4NTI.

Yes, forgot about the SDK-85. Used that in tech school way back in
1981. That was a smoking little bare-bones computer system...

Any IBM PS/2 model would be perfect. They can be had for next to
nothing and are well-nigh indestructible.

Hi Sam,

Actually I love your setup! When I as single I had an office scarily similar to what you have now, and we even have alot of the same books! I even have those two boxes of Suse 7.2 and 8.1 on my shelves, plus OS/2, though mine's 3.0 Warp (still shrink wrapped btw).

When my wife and I married last year and she moved in, our offices got consolidated and most of my books got put in the closet. It's fine for the most part as most of the books I don't use, but it's still neat to walk into an office and have floor to ceiling computer books :) Always something on hand for those late nights when you can't sleep. hehe

A friend of mine has a C64 he's not using, and he plans on sending it to me. Also another guy I met on QRZ is sending me his old cable he used with the Tandy TRS-80 Coco 3 to do packet radio. It goes from the RS-232 port to a TNC, so maybe I can get something going there.

So tons of fun stuff on the horizon!

Take care, and thanks for the pictures! I love'em!

Alex

> 20, or a TI-99, or a Commodore 64. Power users swear by'em.
>
> SC

Hi SC,

Yup, I got my tech ticket a few months ago, and I'm now working on learning code and studying for the general ticket. I hope maybe January or February, but not until I can get my ham nook setup in the garage plus move my radio from the car to the garage so I can actually focus on the radio :) It's hard learning how to ragchew while on the interstate. hehe

I do have a C64 on the way, and that plus what I have now should be enough to get me going. Too much fun!

Take care,

Alex

Pot / Kettle / Black

> BTW, what is your call?

What does it matter, Brain?

You don't sign YOUR call here!

You unceremoniously dropped your "billybeeper" personna for
"hot-ham-and-cheese", trying to hide your identity until your ego
overcame situational awareness and you did sign a post.

I can't help but wonder which one of the other annonnies may be you
right now...Afterall, that is your MO.

No matter...You'll do it again...You'll let your ego get ahead of
your common sense and you'll out yourself again. You always do.

5579. Q of coils made on ceramic form?

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-06 15:57:30 UTC
From: eternalsquire@comcast.net
Message-ID: <1165420650.198866.59380@n67g2000cwd.googlegroups.com>
Source record: 9430

All,

I've been hearing how winding coils on discarded plastic pill bottles is not suitable for RF tank circuits due to low Q, and that these would not be safe for tube circuits anyway due to melting point.

I have access to kaolinite clay (white porcelain) and a kiln, and I was wondering if I molded and fired this type of clay for coil forms, what effect on a tank circuit Q this form would have.

Thanks in advance,

The Eternal Squire

------------ REPLY FOLLOWS ------------

Are you remotely aware this is a newsgroup for Amateur Radio Operators
who like to build (i.e. homebrew) their own equipment?

If your "legit" product is not related to the homebrewing of radio
equipment, it does not belong here.

That mysterious "W6WRT" is my amateur radio callsign. What's yours?

What frequencies are your coils going to be operating at? I'd be really
surprised if pill bottles had any significant loss at HF.

You must be talking pretty high power designs if you're able to melt plastic!

Is it a filter? It sounds more like an oscillator.

Although the frequency is probably not the same as what you're going to use the coils for, one way to test the loss of an insulator material is to put some in the microwave oven (along with a mug of water to provide a load for the magnetron). If the insulator material gets hot, then it is lossy. Of course you would have to fire the clay before testing it, otherwise the water content would make it get hot anyway.

If the pill bottles are polypropylene or a similar non-polar plastic then they are probably not very lossy, but of course if the current through the wire makes the wire hot by normal I^2*R losses, then the hot wire would melt the plastic. This would only be a concern in a power amplifier or tube circuits as you mentioned.

Post restructuring License EXAM

(Simplified test approved by all book and magazine publiher and
VE whorehou$e$ who $ay "We need more ham$")

Please PRINT (that means no squiggly lines)

YOUR NAME (what they call you) _____

ADDRESS (where you live) _____

BIRTHDATE (when you were born) _____

EXAM

Instructions: Make a circle (one of these round things O) around the
letter of the best answer! This is so we know what your answer to the
question is!

1. You TALK into a microphone with your _____.

A. Hands
B. Feet
C. Toes
D. Mouth
E. Armpits

2. When you talk into a microphone, you talk into _____.

A. the front
B. the back
C. the top
D. the bottom
E. the wire

3. "HEADPHONES" are worn over the _____.

A. Knees
B. Eyes

C. Toes
D. Ears
E. Lips

4. What do you do with the AC line cord coming out of a power supply?

A. Hold it in the air to pick up signals
B. Pull on it to start the motor
C. Talk into the plug to get real "skip DX"
D. Hook it to your antenna
E. Insert the plug into a source of power

5. A "two meter" radio is:

A. twice as strong as a one-meter radio
B. two one-meter radios in series
C. a CB with two meters on the front panel
D. a good doorstop
E. yo mama

6. A "ten-foot mast" is how long?

A. Ten feet
B. Ten pounds
C. Two meters
D. Tree-top tall
E. yo mama

7. A "Triband antenna" is made to work on how many bands?

A. 1
B. 2
C. 3
D. 4
E. 10

8. The "Marconi" antenna is named after:

A. Marconi
B. Mantovani
C. macaroni
D. Dean Martin
E. yo mama

9. What colors of DIODES can you buy at a Radio Shack store?

A. Red, blue and black
B. Red, yellow and green
C. Orange and brown
D. I am colorblind so this is a discriminatory question and I should automatically get my license because you have been mean to me.
E. I have no intention of ever using DIODES, so I should get my license for free.

10. What color of SLURPEE can you buy at 7-11?

A. Red, blue and black
B. Red, yellow and green
C. Orange and brown
D. I am colorblind so this is a discriminatory question and I should automatically get my license and free slurpees forever because you have been mean to me.

END OF EXAM.

YOUR SIGNATURE (slap yo tag here)

Scoring:

Get THREE correct and you get an EXTRA!!!!
Get TWO right and you get an ADVANCED!!!!
Get ONE right and you get a GENERAL!!!
Miss them all? Just blow the VE and get a no-code Tech Markie!!!

FWIW, I looked at a number of old pill bottles out of curiousity, they are all marked PP No.5 which is Polypropylene. Checking in a microwave oven sounds like a good idea.

> The Eternal Squire

There will be very little effect on Q of an inductor wound on a 1/16" to 1/8" thick wall of translucent plastic as used in pill bottles...as compared to ceramic or epoxy-paper or other plastics as used in commercial coil formers. A quick check on any Q Meter will prove that. [I've done that out of curiosity many many years ago and little change]

A visual clue is the old B&W "coil stock" of heavy wire held in place by cemented-on strips of polystyrene (usually in four strips per long coil stock, equidistant around the circumference. Those were used in the 50s and 60s primarily in tube amplifier circuits under about 200 W.

Using ceramic formers for anything under 400 W (give or take) power level is overkill in insulation. Back in the 30s and 40s use of ceramic was easy in the industry (plastics industry hadn't developed far yet for electronics applications)...so already-in-place ceramics work was an easy way to go for manufacturers of "radio parts." That led many to believe that ceramic forms are "necessary."

The BEST way to go is to sit down and do some grunge work of calculation of RF currents and voltages in a power amplifier L-C network...to see what ACTUAL loss will do insofar as heat dissipation. Q - as measured - will be the same a low or high power levels so the measurements at low levels will still apply to high power applications.

If heat dissipation is a real concern, then that can be simulated with simple AC through a resistance wound around the former in question. Any resistance wire will do, such as the elements out

of an old toaster, hair dryer, etc. Set the low frequency power dissipation the same as what was calculated for RF and watch the results.

By the way, some pill bottles are still molded from polystyrenes with some high end medications stuffed in (of all things) polycarbonate (expensive) containers. The much-storied "Q Dope" (supposedly so great to use on small coils, which it isn't in longevity) is polystyrene with lots of solvent. Q Dope will pull away from most surfaces ("lifts") after several months due to adsorbed moisture in the air, losing some of its good properties. Spar or boat varnish (from petroleum products) is better and longer-lasting, doesn't smell as good as Q Dope but can also be used on floors and furniture. I use McCloskey "Gym Seal" myself...rather expensive in do-it-yourself stores, though.

Just having some kind of ceramic molded is never a panacea. Without some good RF dielectric loss measurement gear you won't be able to know if the ceramic mix has strange stuff in it that could result in it being a lossy dielectric. Some ceramic coffee mugs can heat up by themselves due to trace-whatevers fired in with the ceramic. That indicates a dielectric loss at 2.4 GHz...but you won't know what the effect is at lower RF without measuring it.

I would say you have a needless worry on former material. If you want to fire your own ceramics, go for it! :-)

A 10MHz oscillator in a sealed metal can could be a TCXO
or possibly even an OCXO.

Has it a similar pinout to the unit at the bottom of
this page?

Sounds like a Direct-Conversion Rx./Tx. set-up to me. Where the Local
Oscillator is the same as the Rx/Tx Frequency. The ICOM751 should
normally be Zero-Beated to the signal in SSB Mode. But using Incremental
Tune to set the Side-Tone in CW Mode else you would end up chasing a CW.
signal up and down the band. The other source of the problem might be RF
leakage from an unshielded Tiny Tornado, radiating back through the Rx
Rf stage ! This was how German Submarines were detected, even during
"Radio Silence" in WW2. They were leaking the LO (Rx +/- IF) back to the
antenna in the RX mode. This was Cured by an extra RF stage between the
antenna and the first mixer. This is how unlicensed TV sets were
detected in Great Britain, BC (before Cable).

No doubt many are saddened by the senseless loss of James Kim, the family man that perished in the mountains of Western Oregon early this week. I think what makes it all the more tragic is that here was a person who was on the cutting edge of all the latest and greatest high tech computer and communications technology. Blackberries, photo cellphones, wifi PDA's and laptops, etc. I'm stunned a person in such a high tech vector could become so completely isolated in such a short distance from the mainstream.

This worries me because it highlights the shortcomings of all this new high tech gimcrackery. As I understand it, even satellite cellphones require a service provider with a nearby uplink antenna. So, this brings up my question, as a non ham:

How long do you think it would have taken James, or anyone in that situation, to make contact with outside help and get him and his family out of there if he'd had something like a basic QRP tranceiver and antenna and knew how to use it?

Any thoughts you may have on this issue would be appreciated.

nb

I'm not sure what "shortcomings" you're referring to; no cell phone or WiFi vendor suggests that you're somehow going to be able to get service out in the middle of nowhere, miles from any populated town.

> As I understand it, even satellite cellphones
> require a service provider with a nearby uplink antenna.

No, plenty are 100% standalone. You're probably thinking of models that effectively act like traditional cordless phones back to a basestation so that the handset itself can be small and light and have good battery life.

> How long do you think it would have taken James, or anyone in that
> situation, to make contact with outside help and get him and his
> family out of there if he'd had something like a basic QRP tranceiver
> and antenna and knew how to use it?

(Assuming an HF band transceiver...) Not long at all.

If he had made various short hikes from the car to the surrounding hill tops perhaps he could have managed to hit a cell phone tower as well and successfully made a call.

> Any thoughts you may have on this issue would be appreciated.

Although we'll probably never know exactly what he was thinking, I've been on the road in question and to most people it justs scream "do not enter!" in winter... at least not without much better equipment and supplies, including a different vehicle.

I'd be curious to learn if he used a piece of mapping/routing software to choose his course; I've seen some that will choose the road he did because it is shorter, in mileage, than the main highway out to the coast -- not considering that the road is narrow, gravel, and otherwise rather treacherous in winter. (Even in summer it's significantly slower than the main highway.)

Well, the _right_ high tech gimcrackery (a "personnel locator beacon",
e.g. <http://www.landfallnavigation.com/spwff1.html>) would almost
certainly have been effective. And I'm sorry for his family's loss, and
can appreciate that Mr. Kim must have felt that taking action was
necessary to save his wife and children, but had he _stayed_put_ he'd be
alive today.

Thanks for posting this Jim. Maybe now people will see that dumbing down ham radio was a bad idea.

That would have been a flashing red light for me. In fact, I think I took that hwy (42?) from 5 to the coast back in '75. Is that the highway that's the usual detour to the Coast when 5 at Grant's Pass is closed? If so, we did take it in snowy weather at night and were even less prepared than he was (I was real young and real stupid). But, I was smart enough to stay on the road that actually had traffic, including trucks, on it despite it becoming pretty lonesome on some stretches. We also put on chains (the state patrol required it).

I agree...here in the Northern U.S. where we (usually) get plenty of snow and ice, we were taught to stay with the vehicle (and it's always a good idea to have an emergency supply of food and water in the car, especially in the winter months). In the case of an air search and rescue, it's far easier to spot a car on the ground (which is usually very near to a road) rather than spot a person in the woods...

That is really rugged country... And even with a determined multi day search by air and snowmobile they only found her by accident... Likely if she hadn't had the umbrella they would have sailed right on past without seeing her... It is sheer happenstance that any survived.. Given this coddled, technological world we live in, we have lost our fear of nature... We walk around in freezing weather wearing only a light jacket, get into a self heating car and drive away from the suburban streets into rugged country with the Sirius music playing and the kids banging on the gameboy...But when our technological tools fail, we are totally unequipped to survive in a situation of being stranded in a hostile environment...

Could I have made the same mistake? Maybe... But, I am the product of Northern Michigan, I live in a rural area, I drive 5000# of 4X4 truck, I usually wear a -20F parka, even to run to the store 2.5 miles away... Maybe my inherent caution would have made me question that road and turn around... Maybe not... Glad it was not me...

Official Oregon State maps indicated in red ink the roads
that are closed in winter, off the shelf Rand McNally map did not.

with all the trees out there, too bad he did not carry a leatherman
tool.

burning the tires was smart.

wonder if he knew how to build igloo or other type of shelter.

we never travel in that type of area but
when we do travel by car, got plenty of food,
several boxes cereal for me not the kids !,
cooler with drinks and h2o and several
road flares (makes fires fast) and my 2m/440 mobile kenwood
and ht.

also have old cb from 1975 and it works.

Well put.

Living in northeast Montana teaches one to NEVER go out, anywhere, unless you are prepared to spend time in a hostile environment. There are those who do the same thing every year up here, fortunately it usually has a happier ending. Nature is very unforgiving and could care less who you are, where you are from, what you do, etc., etc. Lose sight of that and forget to respect nature and some hard life lessons will bestow themselves upon you, some of them can, unfortunately, be self critiquing.

Yes, indeed. Any road trip into the western half of the US (New Mexico
and points west) this time of year will see me do these:

o Move the HF rig into the van, as well as the FM dual-bander;
o Install the HF antenna mount on the van;
o Carry a straight key and antennas for 40, 20, and 10 meters;
o Carry both 2m HTs, spare batteries, and battery chargers for them;
o Load up with food, water, cloth blankets, flares, kitty litter,
reflective Mylar blankets[1], 2 shovels, and flashlights; and
o Give _very_ serious thought to what _else_ I should carry.

We've got to drive from OKC and back over this weekend, and that's how
I'll load up the van today, even though the forecast is for good wx.
I've been called an over-cautious fuddy-duddy because I think like
that, and I'm still alive because I think like that.

Even on well-traveled roads, you can get into Too Much Trouble in bad
weather; back roads in untraveled country are, as we've just seen, far
more dangerous.

Garrison Keillor said it very well indeed:

"Life is complicated, but winter narrows it down to a
few simple problems: heat, food, shelter, plumbing.
And it focuses you in wonderful ways. You don't have
to search for your personal identity in winter; winter

gives it to you. You are prey in winter; nature is
making a serious attempt to kill you."

[1] Life-savers when it's _cold_.

This is a direct-conversion receiver: the beat-frequency oscillator
operates just off the 7.040MHz frequency. Enough of it leaks out of the
unit (especially depending on what kind of case you put it in) to be
picked up by your IC-751.

Al,

You had the best answer. I never seen so much bs in a thread. When the glue first came out it was not uncommon for the emergency rooms around the country to have patients with eyes glued shut. Just like the 84 year old lady who successfully sued McDonalds because of burning her crotch with their hot coffee. Now they serve their coffee at a lower temperature. Doesn't taste as good.

Cordially,
west

I remember reading the MSDS for super glue many years ago and it specifically mentioned that it wouldn't actually harm your eye, and the best thing to do was just wait until the skin naturally dies rather than trying to force open the lids. Ewwww....

I'm sure it stings like a @#$@ though; just getting my eyes close to the stuff makes them sting from the fumes.

> Just like the 84 year old

Just to be fair to Ronald, the particular McDonalds in question was serving their coffee considerably hotter than they own internal guidelines said they should have been.

> Now they serve their coffee at a lower temperature.

Definitely a case of one bad apple (the restaurant) ruining it for everyone.

Didn't ruin it for everyone, my Mom had already taken care of coffee for me.
She sneaked a dose of castor oil into a cup of coffee to trick me into
drinking it when I was seven years old.
That's the last cup of coffee I ever had. I still detect a slight tinge of
castor oil when I smell coffee cooking.(G) Waagh! I'm just glad she didn't
find a way to spoil the smell of gunsmoke for me.

No, the bands are going to get worse over the long haul. We got people that don't want to be skilled knowledgable hams. If they're too lazy to learn CW they are going to be too lazy to learn other things too. Technical discussions will decline. It will start to sound like CB.

I give ham radio fifteen years after the code requirement is eliminated to totally get there, but it will be noticable that it's going downhill quality wise within the first five years.

Just listen to the no-code ignorance on repeaters, you don't think thats no going to migrate to HF?

Roger that! I have a Yaesu FT-857 in my truck so I have HF through 440
and antennas for all bands. I'd be screaming my lungs out on 40M or 20M
or whatever band I could raise somebody on!

keep in mind, he, like most of us, was just a middle class guy who had essentially no experience in rugged, snowy terrain. He lived in SF, in the city. His family was going up to visit relatives. How often do normal middle class folks carry a big-ass survival kit that would help them survive for weeks in the snowy wilderness, even when they're driving through the snowy wilderness between two major metropolitan areas?

It just lets us know what everybody who lives in Alaska, or North Dakota, or Montana, already knows -- far away is closer than you think.

From the European perspective, I do not understand this discussion.
Most European countries (except Russia) removed the CW requirement
after a few months of the ITU WRC decision that CW test is not
required at frequencies below 30 MHz.

I haven't observed any problems with persons using the HF bands
without the CW test.

Listen for yourself, can you tell which European operator has passed
the CW test and which one has not passed the test.

being a tech in USA I am sorry I don't reconize your prefix

US hams are such stick in mud as to opose ANY change ever and claim
the sky is falling

I will corect you

thier is no disscussion going this a merely the last stages of the
long and bitter struge to finsh the task of ending code testing in the
USA

and Id expect this lang to get worse before it gets better

I don't know if or when they dropped it), but the Soviet Union had
a no code HF license starting around 1956. Japan also had one
at one time.

From the point of view of the "DX", like you Paul, I'm glad that
the low end of the 40m and 75 meter phone bands was extended. I PREFER
SSB, a 20 meters has been open to the U.S. on "good days" for around
20 minutes.

Due to the influence of the Israel Amateur Radio Club, the code
requirement has been kept. With the IARC's other policies, including
operating events when relgious hams can't operate, pushing for
a five year requirement to convert a foreign license for new immegrants,
etc, they really have become the superfulous old man's CW club,
dragging the hobby down with them.

Geoff.

Other countries are not a problem. Personally I do not attempt to predict what will happen in the US. However some fear that with easy licensing and the lax enforcement here that there could potentially be serious problems. They fear a repetition of what happened to the Citizens Band here. With little to no enforcement of violations, that band became such a sewer that you don't dare let kids listen to it. Recently two CB operators got into a fight over the radio, sought each other out, and one was killed. It is not the world we fear but ourselves.

Actually, in those mountains, a 2 meter hand-held would probably have
given him someone to talk to.

I'm of the opinion that the ARRL feared to give US radio amateurs
their independence from morse code testing. :-)

5633. Need help with ailing antenna bridge...

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-09 21:24:01 UTC
From: WA5PSA <briefer@gmail.com>
Message-ID: <1165699441.158648.55760@n67g2000cwd.googlegroups.com>
Source record: 9334

I've got an MFJ204 antenna bridge that's sickly. It has bands A thru D. Bands
A thru C work just fine. However, only the upper portion of Band D works
(usually between 19MHz and 35MHz). But, between 11 MHz and 19 MHz the oscillator is usually dead. I can sometimes get it to spring to life with just
the right setting of an attached antenna tuner (or by dancing around the room
with aluminum foil on my head), but those techniques should not be required for
factory approved operation.

It appears that the only Band D specific component is an inductor. However, I
think the band switch works by placing additional inductors in series...so the
Band D inductor is always in the circuit, even for Bands A-C. Therefore, I
don't think it's the inductor.

Any ideas why the lower portion of Band D might be dead and what I might look
for?

Details of my efforts can be viewed at http://wa5psa.blogspot.com/
(warning...this web page should not be viewed by someone with a low tolerance
for watching someone "learn" by mistakes).

Riley isn't doing his job?

I think what I wrote before one of the recent restructurings was, "What
I fear most about eliminating the Morse Code Exam is a lack of
enforcement, and what I fear most about maintaining the Status Quo is a
lack of enforcement."

A lack of enforcement is a lack of enforcement, and a Morse Code Exam
CANNOT be used as a substitute.

Be sure to collect evidence of USA violations and turn it in to Riley.
Don't just pass it to your OO.

Secretly, the ARRL would like to see the code requirement go away,
but they can't display that outwardly because it will make them look like
they are against having good skilled hams. Rest assured, when the code
requirement is eliminated, the ARRL (Anti-Radio-Relay-League) with try to
come up with a way to capitalize on the dumbing down of the service so
they can get more money in the corporate bank account.

Not hardly. I was discussing the fact that OTHER people consider it a filter. I have never, ever made any statement to that effect. I was discussing OTHER'S opinions and fears for the enlightenment of the ham from another country who asked why it was such a big deal here.

Just because I chose to discuss the opinions presented by some does NOT mean I subscribe to those opinions.

5646. Antenna in the attic question

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-10 15:42:23 UTC
From: AndyS <andysharpe@juno.com>
Message-ID: <1165765343.577779.158140@f1g2000cwa.googlegroups.com>
Source record: 9347

Andy writes:

I would like to hear some discussion/advice on the feasibility of putting
an antenna for, say, 30m in the attic versus on top of the roof...

Here is the situation :
The roof peak of my house is about 50 feet and is straight. Given the
need for a dipole which is 44 feet wide, it can be mounted in either of two
places:

1) Just above the roof peak, straight along it, about 1 foot above.

2) Just below the roof peak,inside the attic, about 1 foot below .

Let's assume there are no other options...

So it sort of boils down to whether the wood and asphalt barrier , free
of metal except for an occasional nail, actually attenuates the signal enough
to bother about, or affects the antenna impedance enough to bother about.....

Having made dozens of ham antennae over the last 40 years in configurations
that probably violate the laws of physics and having had them work, I, personally,
haven't found that such a difference in the antenna placement makes a hill
of beans worth of REAL difference (no pun). But a lot of guys here have been
doing this for 40 years also, and I'd really like to see what anyone has to say
about it.....

I generally use one rule of thumb on antennae:

" If when I connect the antenna to the receiver, the background noise
of the receiver increases, the antenna is doing a good job".....

Yeah, I know, but it needs some thinking about because if the cosmic noise
level picked up by the antenna is higher than the receiver noise level,

then
it has to be working.....assuming it is cut to the proper frequency
for the
band used.....

So, what about it ? Anybody want to put in their two cents worth ?

---------- REPLY FOLLOWS ----------

If the antennas you're talking about really did work, you did not
violate any laws of physics, I can assure you. :-)

I operated with in-attic antennas for years and they do work
surprisingly well. I earned DXCC with 100 watts and an attic dipole in
a matter of a few months.

Go for it.

Andy , You didn't provide the shape of your roof space eg width at loft bottom and whether there is any metal around (apart from nails/screws etc). For an HF roof space antenna I would recommend a wire loop as much as possible away from any metal and with total loop length exceeding the the length of the largest wavelenght you wish to operate on. So in your case a loop of > 10m or say 35 ft would be adequate

A square would be the optimum ,but a 'wide rectangular' is acceptable. Feed the loop with any balanced feeder ,twinlead electrical cable'(75 Ohms ?) or 300 -450 Ohms ribbon or 2 wires with insulator spacers.

It would be best to feed the loop somewhere near the middle of a side

You obviously need a balanced tuner/matching unit ,but might get away with a simple current balun

Good luck

Is the ridge vent metal? Usually it is covered with shingles, but sometimes it is aluminum, sometimes plastic. I trust any foil backed insulation is in the floor of the attic rather than the roof.

All other things being equal, I would expect the antenna to be noticeably better above the roof, because there will be some attenuation indoors, and greater proximity to noise makers, and things that can get overloaded by your transmitter.. But I doubt it would be a huge difference, although on wet days it may well be sigificant. If the vent is metal, then the attic antenna, because you can get it farther from the vent, may well be better.

But "better" is a relative term. I suspect in 4-land you don't get the snow and ice we get up here on the tundra, but I imagine you have pretty decent storms come by once in a while. It may well be that the slight attentatuon is a small price to pay for not having to re-string the antenna every time hurricane season rolls around.

..

> basic requirement is suitable.

and there of course you are plain wrong

Neither Morse code nor cw has been truly basic to Ham radio at any time
in our history in making this statement you spout bogus propaganda

Morse Code has NOTHING whatever to do with radio it just so happens to
exist and was apllied to first spark (which sure isn't CW) as it was
applied to various wired aplication

indeed the Morse Code test know even prove one can use Morse Code (as
can be seen by skimming the threads bashing newbie code users on QRZ)

indeed with you Dee we have a clear case of the dmage done the ARS by
Code testing

we have an extra class our most tested therefore in theory our most
knowledgable class of hma making down right stupid statement about what
Ham radio is

now it isn't entirely her fault of course she is product of th e system
foisted on one by the FCC allowing the ARRL to decide what we needed to
be real hams

it is rather like the case in B5 of Akara 7 where the leader fed
propagnad about what made a real Akaran to leath weapons and turned
them loose during an invasion the result was the they repelled the in
vasion and killed off all of the inhabitants of Akara 7 as well

Dee Flint is a poster child for what went wrong with incentive licensing

Ahhh, well. That changes things. A wire antenna is practically invisible,
but you wouldn't want it in the attic where it could attract lightning
inside the house.

Well that settles it in my mind, do it inside the roof as high as u can get it.
(use rope and pulleys so u can later play with it, when the urge hits)
It should work almost as well as of it were outside and 3 foot higher.
Easy to get the feel line to come away at a 90 degree angle.
(not necessary, but if it does great)

and last but not least
It will save up your exterior adornments play with the xyl for a later project.

Andy comments:
Well, the difference between being "practically invisible" and
being
pre-emminent in grotesqueness to my wife is "practically negligible"
(grin).

I'm not certain that an antenna "attracts" lightning. It probably
makes
little difference between hitting an outside antenna, running in the
feedline, and burning down the house VERSUS going thru a layer
of asphalt shingles and doing the same thing..... but I can see where
you're coming from.....

However, in Eureka we don't usually have problems with lightning
because the tornado usually blows the antenna away before the
lightning strikes......

5673. Converting AM Car Radio to Shortwave

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-11 02:56:44 UTC
From: julian814 <julian814@hotmail.com>

All right, I think I might have found the proper place to ask about this. Back in the 90's when GEnie was still around, they had plans to convert old AM car radios to shortwave receivers. My old Franklin ACE 500 computer wasn't capable of interpreting the file at the time, so I didn't get to download it. I'm hoping someone here might know where I could get the instructions.

I know, I could just get off my lazy ass, get an ARRL manual and figure it out for myself, but if there's an easier option, I'd like to go for it. All I'm looking for is something that will pick up broadcasts between upper AM and the scanner frequencies.

By the way, my hotmail account isn't working, so emailing me won't do any good. Please post where I can find what I'm looking for here. Thanks.

Andy writes:
In my opinion, the easiest, most non-destructive way to do this
is to add a converter, using the AM radio as a tuneable IF for
AM transmissions.
A two transistor converter, using a xtal oscillator and a mixer,
can easily do this. Just select the xtal frequency to be about
1000 Khz above or below the middle of the shortwave band you
want.
I am assuming you are only interested in AM shortwave
broadcasts. Any of the other modes would require modification to
the inside of the AM radio....

Anyway, the neat thing about this approach is that no modification
needs to be done to the innards of the AM radio......And you can
still listen to Rush Limbaugh by switching off the converter....

If, on the other hand, you want to modify the AM radio to short
wave without adding anything significant, it depends entirely on
the circuit. In general, you will rewind a bunch of coils, which
means you need equipment for testing and measuring. There are
some AM radio designs that are such that success is extremely
unlikely while others are fairly straightforward ---- it's like asking
"how much does a rock weigh?"
I encourage the CONVERTER approach.... Good luck with your
project. These weekenders can be a lot of fun and very
educational...

Source record: 9276

Andy writes
Well, I've read the posts here, as well as the vitriol being thrown around,
and it's obvious that a lot of people have strong opinions about the usefulness
of the code test.

As a pragmatist , here is MY two cents worth.

1) No-code operators won't be on the CW bands, so those of us that us CW won't even know they are around.

2) Most, if not damn near ALL equipment being put on the air now are appliances bought in the store what have been type accepted. Consequently, no degradation of technical standards will occur, as MOST of the equipment are designed by professionals anyway, and I doubt that many no-code operators will try to build their own.

3) Those FEW, like myself, who build their own equipment know lthere is NO correlation between knowing Morse Code and the technical design of a radio. We learned Morse because we had to, and either learned to love it or promptly forgot it as we designed our
SSB and FM radios for the next several decades.....

4) Finally, the ONLY concern I have is that portions of the CW bands may eventually be taken away and given to the appliance operators. If interest in the CW bands dwindles, that's probably just an evolutionary step... However, having CW as a requirement will NOT make newbies want to use it when they can just talk into a microphone and jabber away. It's a new breed of internet-savy operators, and already the newsgroups (like THIS ONE) are attracting far more people who like to talk with strangers than an expensive appliance that interferes with the wife's TV programs .... I'm afraid ham radio is dwindling, but it will be around for the rest of my lifetime, and that's OK .....

That's how I see it. Having a code requirement is simply an obstacle to hurdle in getting a license. It may as well be required for a driver's
license for all the "technical" good it does. On the other hand, it does give us Extras a sort of "elite" status for having earned it.... I'm glad to have the ability to have Morse Code, typing, memorization of the
color codes, and good looks on my resume....

I'm not a ham, I just enjoy the discussions here.

My two cents worth.

When we got our first TV in the 50's, my father wanted to install an antenna but was leery of going up on the roof. I told him to put it in the attice. He did and it worked just great.

After we moved, we did the same in the second house. No problem.

Maybe the fact that we lived about 10 to 15 miles from the Empire State Building in NYC may have had something to do with it.

I now live about 2 miles from three 1100 ft. TV towers. The rabbit ears in my basement work just fine ;-)

I also get audio on my telephone. Grrr!

Al

Thanks, Andy. I think I've managed to find something a little better
than what I had in mind, anyway - Lindsay books sells a series of books
called the Impoverished Radio Experimenter. I've ordered two of them
that seem likely to have the information I need. My only concern now is
being able to run a tube receiver off of battery power, but I'm hoping
I can figure out something on my own.

Andy writes:
I agree with Bill W6WRT.

Since I have seen so many postings about this on this newsgroup, I
just ASSUMED that folks here wanted to talk about it.....

I did a "reply" using "google" to one of the other posts, and found
that it was multiply cross posted to a LOT of groups, meaning that
somebody just wanted to make a fuss..... TROLLING.....

I apologize to Bill, and everyone else here, for not looking more
closely
at the subject before posting to rec.radio.amateur.homebrew

I can't say it won't happen again, ever, but I'll try to watch it in
the future, and would ENCOURAGE anyone who just hits a
"reply" button to check to see if it is being crossposted.... If it is,
please go to the group that is interested in it and don't plague
the newsgroups with spam..... as Bill and I have just done (grin)..

"AndyS" (andysharpe@juno.com) writes:
> Andy writes
> Well, I've read the posts here, as well as the vitriol being thrown
> around,

No, the posts aren't here, they are cross-posted by idiots who think whatever it is they have to say is so important that they need to spew it across the newsgroups.

If you really wanted to address the issue, then you go elsewhere to post, where such posts belong. At the very least, and you should always think twice about it, you reply to the cross-posted junk rather than start a new thread that is only in rec.radio.amateur.homebrew YOu can even reply to those existing threads and take out the irrelevant newsgroups, such as this one.

For most of a decade (and likely before) we've been relatively isolated, as if the people who do all that cross-posting don't think that building radio equipment is actually part of the hobby. But their need to spread their junk has meant don't keep it in rec.radio.amateur.policy where it belongs, they don't even keep it there and in rec.radio.amateur.misc where it was often kept until relatively, they spew to all kinds of newsgroups as they catch on that there are other ones. So they spew into rec.radio.shortwave, and the spew into the more technical newsgroups like this one and rec.radio.amateur.antenna

LIke Bill Turner said, don't reply to them. But that doesn't mean starting the arguments here in standalone threads, either.

>converter....

Or when you switch it on...

http://www.techlib.com/files/rushconv.pdf

Pick your 1MHz band, and tune away. You'll need to tweek a bit if
you want to be very far from 15 MHz.

Andy comments:

Excellent, David !!! Thanks for the circuit. Note that it can
easily be modified to get WWV also..... I suspect one could
use a CA3028 if one wanted to build it with a single IC, for some
reason...

Yet another simple converter can be made using a NE602.
I don't have a circuit handy, but it can easily be designed from the
data sheet.
Andy W4OAH

PS I'm going to check out 15.42 Mhz --- I hadn't messed with it
before.....

If you choose the 31 and 25 metre bands you can receive both with one crystal in the oscillator. Many years ago I built a simple converter using a 10.7 MHz crystal and a tunable front end so I could tune 31 m band (osc on the high side) and the 25 m band (osc on the low side). Don't remember now where I got the circuit but it worked very well with a standard (in those days!) car radio antenna.

Andy, Welcome to the group.

A lot of people here want to talk about it and find your point of view on CW interesting reading. Just ignore Bill Turdner. Don't let his insults bother you, he likes to act like an asshole sometimes. If the ship he was on was sinking he wouldn't know about it until he was drowning. As far as your view that CW is just a hurdle to getting a license, I vote for keeping the hurdle. At least when they get licensed they have a skill then. To many of them just want to get a license and talk on a microphone. Any CB'er can to that.

Right click on the link on the left side of the page.
(Selecting the specific show you want to download 1 through 43.)
then select save as......

example: the < http://www.soldersmoke.com/soldersmoke43.mp3 > link

Or copy and paste the url into winamp or what ever is your mp3 player.

AS with any high powered RF device -- or even Pentium 4 microprocessors --
thermal design and proper thermal construction is CRITICAL,
I would use a copper spreader for building this amplifier due to the close
proximity of the 4 RF transistors.

This is NOT a beginner's project or kit
Here are other web sites with thoughts and construction details, notes.

TUBES!! Tubes? Off of Battery, 6 Volt?, Vibrator? Inverter? 12 Volt B+
tubes ? Not since the 1950s ?
Am I reading too much between the lines ?

Yukio YANO, VE5YS

Except for the audio output stage, we can now run a radio on the power
used to to light the Dial on a Tubes Era Radio !

Yes, tubes. I have some that were pulled from circa 1960's television sets, and I thought I'd use them, hoping that they'd be EMP resistant. Been on kind of a survivalist kick, lately. Doesn't mean I'd be opposed to using more modern equipment, though. One thing I saw that I liked in one of the books I purchased was a loop antenna that uses transistors to amplify the signal. Thought it might be easier than stringing up a lot of wire. ;-)

I'm not that terribly fond of Rush, but I think I might be able to
adapt this to tune in other frequencies, so it should come in handy.
Thanks!

But the transistors almost certainly will be fried by EMP. If that's
not a concern, then by all means try it -- and share the design and
results with us, please!

If that was the test you took it explains a lot.... It sure explains why you are so fearful of the CBers taking over. You never passed a valid exam, so you might want to turn in that ticket and try again. Let me know where you are and we will find you a testing session close.

We still don't have your call there SC. I'm thinking that you may not actually have a call and are just jealous of us folks that passed the tests.. (Grin)

Newsgroup wrote:
> I am currently in the process of building a eb104 kit. has anyone else built
> one of these kits. What are your thought on this amplifier.

It is not actually a kit. It is the circuit board plus all the components to populate it. To have an actual working Amplifier that you can get on the HF bands you will need: T/R relays, low pass filters for the bands you want to use the Amp plus a means to switch these filters, 50 VDC 20 amp power supply, copper spreaders+heat sink+cooling fans to get rid of the heat, some kind of enclosure with switches, connectors, metering ect..

Optionally, you may want an ALC circuit, and an SWR protection circuit. The MRF150s are about $80 each, I let the smoke out of 8 before I got mine working. I built two eb104s with a combiner for 1200 watts output, but it was a struggle. Essentially you have to come up with your own kit. It takes about a hour to populate the eb104 circuit board. It took weeks to have a working Amp. Good luck.

I'll admit that the idea of a tube receiver is partly based on looks
than EMP survivalbility. (I managed to find eight wonderful old
headsets at a school sale. Bakelite earpieces and cloth wrapped wire!)
I thought it might give me more of a 50's era Cold War feel. I'm sure
I'm not the only one who likes using tubes as well! ;-)

As far as using solid state, I wouldn't be opposed to it, especially if
I could figure a way to shield the parts from EMP. The main reasons I
wanted to adapt a car's AM radio was because they're cheap (I know for
a fact there's one at the local resale shop) and have a certain amount
of shielding, plus they run on 12 volt DC. I've discovered they have
plans for a shortwave converter in another of the Impoverished Radio
Experimenter's books, so I might look into that. There is also a bit of
that post-apocalyptic feel of using "junk" to listen to the airwaves.

I'm seriously considering getting a ham license. So far, the only thing
holding me back is learning Morse code for CW.

Thanks to all who have posted with suggestions, advice and comments.

Hey thanks, Bill
I downloaded a few of your programs and installed them on a MP3 player.
My first attempt at such a thing, it all went smoothly, I listened to the
discusion
while on the treadmill and while working the weight machines this morning, I
enjoyed the conversation. I'll be adding more soon.
I bought a cheapy MP3 player at FYE, hold on now, list price is $29.99, it
is on sale for $19.99 and has a $10.00 rebate. So the final cost is about
$10.00!
Works fine but it is bare bones.
Thanks again for the feed,
Mike

Do a search on Code Quick. I think the URL is www.codequick2000.com or something like that. It's a combination audio/visual/tactile system that teaches you how to copy morse code as if it were words and not beeps.

Worked great for me, I tried for 29 years and never was able to get anywhere near 5 wpm. With code quick I was able to pass the 13wpm test and at my peak copy at 35wpm.

Best $50 I ever spent on the hobby.

Geoff.

He won't see this reply. He is an Earthlink subscriber,
as am I (Netcom is an Earthlink company). For the past
several days Earthlink's news servers have not been updating
messages. Only a very few groups work, the rest have no
messages newer than about 8 December. You can download
existing messages and post but new messages just don't show
up.
I've been using Google groups and am now using a freebee
Teranews account.
Earthlink is a godawful provider but one hears horror
stories about most of the others too.

Heck your hot mail dont work my links dont work. so try nj7p's tube
data web page I'm sure it has a link to an RCA tube manual. In the back
of the RCA tube manual is many a circuit an the older the manaul the
better the tube circuits are or were. I recall a converter or two back
in the day, all tube radio, on a points/distributor ignition system
car, yeah vibrators those were the days. You know the trick to clean
the contacts on a vibrator 100 watt light bulb in series with the coil
and plug it into the mains

Then just about the time tung sol invented the 12VDC plate voltage
tube, transistors took over.
I even know how to make a tube out of a dual filament car taillight.
Now there's a real tube.

==========
You currently only need to do a 5 wpm morse (receive only) for the
highest class of licence ,giving you all the privileges available to a
licenced radio amateur.
So you can start with with getting licences with not all the privileges
and enjoy operating before you go for the Amateur Extra class of licence.

What do you do if the input impedance of an LNA does not equal the source impedance which gives the lowest noise?

The source might be an antenna, transmission line or filter which will not work properly if it does not see the correct impedance.

Hank,

We appear to be crossing paths or whatever that cliche is...

I did not receive your email because I forgot to change
my old (obscured) email address in my news reader program.
I sent you a note to what I thought your correct email address
should be based on what I saw in your post, but I guess you
did not get it either.

Anyway, send me your mailing address using this email address
for me:

pj2006 at alltel.net

(you know what to do with the "at" part)

I'll fire off the manual via media mail through USPS. You should
have it in 7 to 10 days according to the post office.

73,

phil

The HF-1250 used a single 3CPX800A ... so it really is a single tube version
of the HF-2500.

I have not received a reply from Ray at QRO and, no, he has no
documentation for the HF-1250.

Besides the HF-1250 using only one tube there are other differences
between the HF-2500 and HF-1250.

Thanks for the suggestions.

Possible changes to some components for current and power increase.

One tube designs are not always economical -- when the cost to add an additional tube and parts changes is small (on a unit cost basis) -- you already have the case, meters, transformer (possibly a bit higher current ratings) and relays. IF the specific tube used in the amplifier is inexpensive -- that is usually the deciding factor.

This is veering off the question, but will make a couple of comments
and then drop it.

I've been able, thus far, to determine that the band switch is
different (the HF 1250's is better!) the tank coils are different and
also is the 4:1 transformer (location and size). Oddly enough, the
power supply is the same! The HF 1250 power supply really loafs along.

Another factor, for me, was I don't want to spend the $$$ to put in a
220VAC service and for amps running 500-750 watts (we're talking key
down here) the single tube amp is a good choice. There's more than
just the cost of the amp itself involved.

Now back to my original question.

I wouldn't mind knowing how to do that myself. One of the really good
radio books from Lindsay tells how to make your own vacuum tubes and
transistors. I'm thinking of picking that up as well.

I've been told that "real" hams know code. For now, I'm mainly
interested in listening to news from outside the US and possibly any
Civil Defense frequencies. Would definitely be interested in listening
into any frequency that plays old time radio programs.

There was a place on the East coast, maybe in New York, that was selling
them for about 90 dollars for a rail of 25 of them.
I don't have the name of them anymore. Some of the other places were selling
them for 225 dollars per rail.

If this is not a forgery, and if you are indeed Slow Code, you will be
missed.
Carry on, buddy.

Mr. SC... I agree with your premise that losing the code requirement
will operate to the detriment of ham radio in the long term...
I do not agree with your premise that continuous spamming of multiple
groups with garbage postings did anything except make you feel
important... Good riddance...

denny / k8do

5739. Antennae base

Could use some help please. I have a tip over used tower. I want to install it and don't know what depth and width the hole has to be and do I have to use rebar. Can someone help me? Thanks.

>> Now there's a real tube.

I, too, would like to see a circuit which demonstrates that "tube"
did something useful. Is it just a diode (i.e., rectifier), or
can it also amplify?

I am NOT an expert, but I can tell you what I did for the base of
my 20-foot (when lowered) tip-over/crank-up tower: I purchased
an 8-inch diameter 6-foot long pole ("corner fence post") treated
against termites, cut it in half, sank the two halves side by side
until only 3-4 inches showed above ground, placed a five-sided box
made of treated 2-by boards (2x4 around the sides and probably (I
don't remember) a 2x12 on top) over the top, bolted the sides to
the posts, and mounted the base on the top with some long bolts
straight through the 2x12 and down into the posts.

The above base is about a foot away from an outer corner of my front
porch, and above that porch is an upper deck with a 4-foot-high
railing (railing is maybe 14 feet above the tower base). My tower
came with a kinda-Y-shaped gizmo probably made to attach to the side
of a house to hold the tower upright, so I attached that gizmo to
the railing (after reforcing the railing both directions).

I use a spur-geared (? May not be the right word, but it MUST be
cranked to raise AND lower) crank gizmo (my brain must be giving
out - I can't think of the correct words!) and long cable for
lifting and lowering the tower (always when the tower is cranked
to its lowest position, of course).

Installable by one person, no concrete, no rebar, not "engineered"
in the usual sense, but I live in the country with no houses nearby
so I didn't have to follow any "code", and I feel quite comfortable
with it. (If I didn't, I wouldn't have done it that way!)

Awww, c'mon Slow!

To use the vernacular of the left, "It was the Exam, stupid." The mode hasn't changed... hell, it hasn't changed since the 1840's! What needs to change is your attitude about how to entice folks into the Morse Code fold. Since the government stick is gone, you'll have to sell Morse Code on its merits. And here's one last hint, you'll attract more folks if you use sugar. Good Luck.

In article <12o7tv8o2hvm2b8@corp.supernews.com>, rcklfrtz@socket.net
(known to some as rcklfrtz) scribed...

> Could use some help please. I have a tip over used tower. I want to install
> it and don't know what depth and width the hole has to be and do I have to
> use rebar. Can someone help me? Thanks.

Contact the tower manufacturer (it'll probably be Glenn Martin or
Rohn). They will be happy to give you the specs.

Happy raising.

I am actually surprised to find out it was/is Vince. He's an O.K. guy,
puts in volunteer time and is very knowledgeable. While I firmly believe
this alter personality detracted from Amateur radio (Slow Code), Vince
has done other things to advance it.

Although I know Vince is very pro Morse code, I am having trouble
believing it was him (being Mr. Slow Code)

If it was/is him, turning in his license would only be a detriment to
the community IMHO.

All right, I think I've found what I'm looking for, but I'll need some help. I found something on textfiles.com that looks to be close to what I need, but there are some things that aren't quite clear.

http://www.textfiles.com/hamradio/convert.txt

If anyone can help me with the schematics and parts list, I'd appreciate it.

Ralph Glatt

Tubes can be fun. Just be careful not to get zapped by the high voltage
power supplies..that isn't fun.

EMP? If your radio is subjected to one of those you won't be needing a
radio.

Have fun with the tubes and 73,

Bill KU8H

I know a guy down in Ga that made a replacemnet for these. I tused a couple of FETS i think and the whoile cicuit could be built on a DIP header. The limitation of the circuit was that it was not as flexible as the origional, In other words it was not directly plug in compatable all the time but he could always get it to work with a little modification. He is retired now but I usally see him whenever I am down there for Xmas. I doubt if he would want to build any but he would probably share how to build and tweak them with anyone who wanted the info.

Ever since I was a kid, I wanted to be a ham. I could never learn the code. It seems I have a very difficult time memorizing. I didn't know my multipication table until 8th grade. But somehow I managed to get a master's degree in EE and worked as a consultant on a satellite at MIT. Yes, it's still working after 10 years.

Now that all the bands will be available to me, I can finally become a ham.

Oh, and to those who think the waves will be flooded with idiots. Don't worry. After all this never happened to the tech band as far as I know.

But of course, your problem was in thinking you needed to memorize
the code. What you should have been doing is listening to the code
sent at high speed, actually the characters at high speed with lots of
spacing betweent he characters so the overall speed is slow, so you hear
the sounds of each individual character, rather than a set of dots
and dashes. You never go near a code key until you can receive properly,
and you basically toss out all those alphabet to code charts.

Just think of all the time you could have had if you'd stuck with it
as a kid, rather than thinking it was a matter of memorizing the code,
and then thinking you had problems memorizing things.

Learning morse code when I was 12 was one of the easiest things I
ever did, and the only reason I waited till 12 was that before that
there was a rule in Canada that said you had to be over 15 to get
a ham license.

I should also point out that rec.radio.shortwave is not about amateur
radio. It's about reception, and only when someone is talking about
listening to the amateur bands does amateur radio really become on-topic
here. The fact that some decide to spew their junk out of the
rec.radio.amateur.* hierarchy here does not make amateur radio on topic.

Message-ID: <jkuao2584kn2c5h3c1rthnl9hgdddhbvlg@4ax.com>
Source record: 9165

Notice: Effective January 1, 2007, BAMA will add only manuals with a direct connection to the tube era of ham radio. Only manuals for amateur radio transmitters, receivers, antenna tuners, antennas, keyers, etc. will be added to the collection. The only test equipment that will be added will be those items already listed on the "Needed" list and those items created especially for the amateur radio market.

While I appreciate all the contributions of those whose interest is in test equipment and military equipment, I simply cannot continue to expand the BAMA collection in these areas at this time. I will not be removing the test gear and military manuals currently on BAMA. The BAMA collection will remain intact. I just won't be adding to these areas for the time being.

I want to thank any and all of you who are reading this and have contributed to the BAMA collection. Without your time and effort, BAMA would not have been possible. Thanks again and best wishes to all for the holidays.

73,

Ken K4XL

Some people never learned the code because they are lazy. Some were
afraid of the very idea of learning the code and never tried. And there
were some who really DID try to learn the code, but for some reason were
not able to. It is a fact that some people just CAN'T learn another
language. (I for one barely got through French in High School). I DID
manage to learn to copy code up to about 15 wpm though. I jealous of
those people that make 45 wpm copy look easy! Maybe it's easier if you
start real young (just as with piano lessons).

I have a good friend that I meet though a mutual interest in model
railroading. He also attends most hamfests. He was a CB type, wanted

to get a ham ticket, but the code was a roadblock. He eventually got a code-free tech license. (he also eventually, learned the code, just enough to gain Novice privileges).

So don't downgrade people for not being able to learn the code. It CAN be a real roadblock for some people.

Source record: 9170

Lowest noise does not equal highest gain.
Highest gain equals source impedance equals system impedance.
So, LNA equals source impedance gives not necessarely lowest noise.
Tune LNA for lowest noise, the gain will be somewhat lower.
Its the S/N ratio that counts especially important for an LNA.

What exactly do you mean by "will not work properly"? There are a lot of effects possible; reflections on a transmission line may cause "ghosts" in an analog video image, or an improperly terminated filter may not give the needed frequency response. But there are ways around those problems: put the LNA at the antenna, or design the filter to work into the load impedance it will actually "see." Or maybe the lowest possible noise is not a requirement, and you can optimize system performance with a tradeoff between noise and some other parameter.

Lucky indeed is the designer who is able to optimize all parameters at the same time. A big part of design is often selecting the tradeoffs so the overall system goals can be met with enough margin to let the system operate reliably.

Also, you may be surprised to find out just how little gain is sacrificed by using an optimal noise match instead of an optimal power match, or how little a filter's performance is altered by tuning for minimum noise figure.

Finally, can you think of a way to alter the amplifier's input impedance in a way that does not degrade noise, so that you come closer to an impedance match while maintaining a match for optimal noise?

Cheers,
Tom

5771. Power Supply Meters

yep. the amp meter will definitely need a shunt. that value is dependent
on the actual coil current for full scale.

the voltmeter can just wire directly across the output voltage
terminals, but the ammeter will require a shunt.

if the full scale is 50 amp, and the meter is a 1 ma movement, then
49.999 amps must be taken care of in the shunt. the value of the shunt
can be found like this:
you need to apply enough current to the ammeter to get full scale. this
will require a very careful setup.
then measure the voltage across the meter terminals.
now you know V and I.
then you can calculate R for the shunt sine it will be V on the meter,
and 50.000 - the current required to get a full scale reading on the
ammeter.

If the volt meter is not already calibrated it will require a resistor in
series with the positive lead.
Depending on the movement of the meter the resistor could be around say,
49Kohm.

Good luck, Ken, G4KIR.

In many cases you should already have a suitable shunt resistor
installed. In power supplies built around the 723 voltage regulator
IC, there are is usually a low resistance (but high power handling)
resistor for the short circuit protection (usually between the power
transistor emitter and power supply output). When the voltage drop
across this resistor exceeds about 0.7 V, the short circuit protection
will kick in, limiting the current.

By measuring the voltage drop across this resistor, the output current
can be determined. By using a moving coil instrument and a suitable
series resistor, the meter can be easily calibrated.

Since you have a 40 A power supply, there are most likely several
power transistors in parallel, each having a low resistance resistor
at the emitter to balance unequal currents through the power
transistors.

The voltage drop across one of these resistors could be used to give
an estimate of the total current. This is just a rough estimate, since
the currents through the transistors varies e.g. with temperature (the
transistors at the end of the array may have a lower temperature than
those in the middle of the heatsink), the currents are not exactly
equal, so multiplying the measurement with the number of transistors
is not very accurate, but may be sufficient in most cases.

Ummm...it's early here so maybe I missed something. The meter CAN'T
just be placed across the output terminals to measure output voltage.
It will need a series resistor in one of the leads. It's value will
need to be calculated as well.

5777. SWR and resonance measurements without an MFJ269 or equiv.

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-18 15:08:17 UTC
From: Mike Andrews <mikea@mikea.ath.cx>
Message-ID: <em6at1$f9i$1@puck.litech.org>
Source record: 9178

Some friends and I have been looking into making antennas for 70 cm.
and higher frequencies, but we don't have an MFJ-269; my MFJ-259 tops
out at 175 MHz. I _do_, however, have an SWR meter that supposedly
works up to 500 MHz(and maybe higher), and an HP 8640B that is good
to about 1.2 GHz.

If the SWR meter is sensitive enough, could I get at least ballpark
SWR values using the 8640B as a source, running the signal through
the SWR meter to the antenna? Or am I way off in left field?

What kind of "SWR meter" are you talking about? The '8640 may or may
not have enough power to be suitable.

A fairly el-cheapo no-name, but appearently good-enough on 2m and from
420 to 450 MHz. I haven't fiddled with it to see how much drive power
is required.

I suppose I can get a couple of RF amplitude measuring chips and make
the critter active instead of passive, if necessary. The 8640, IIRC,
is good for +20 dBm (3V) into 50 Ohms, or a lusty 180 mW flat-out, but
the finals on the 8640 are unobtainium and so I'm minded to stay well
below that -- and even lower outside the ham bands.

Mike-

You have to try it to find out.

One problem is that your SWR meter's diode output is non-linear for very
low voltages, resulting in SWR being higher than indicated for low
values of SWR. You may be able to get around this with a
hand-calibrated dial on the meter, or a calibration correction chart.

Negative feedback increased input impedance. It looks like lossless
negative feedback will do this without also increasing the noise. Perhaps
use this to make the input impedance equal the noise-opt impedance- then you
can match the two together to the source (using a transformer or a tuned
circuit).

Here is a nice reference:

http://rfdesign.com/mag/radio_unique_inductive_feedback/

The lossless feedback can be as simple as an inductor in the emitter or
source lead.

I've found lots of other references (mostly for-pay IEEE papers), it looks
like stability can be a big issue- no big surprise in a feedback network.

Analog devices makes RF-log amp/detector chips which are good to microwave
frequencies (basically RF in, 10mv per dBm out, from -80dBm to 0dBm).
Replace the SWR meter's detector with one of these.

...

Right. Well, actually, you can use negative feedback to either increase or decrease the input impedance, and to either increase or decrease the output impedance. Negative feedback applied as a current into a summing junction (as in an inverting op amp circuit) decreases the input impedance. Negative feedback applied as a voltage in series with the input signal (as in a non-inverting op amp circuit, or by using a source/emitter impedance) increases the input impedance. Feedback derived from the output voltage decreases the output impedance (tries to hold the output voltage constant, for a constant input signal). Feedback derived from the output current increases the output impedance (tries to hold the output current constant, for a constant input signal).

Just as you say, though, feedback can be difficult to apply at RF, and especially so at the very high frequencies where noise figure is typically the most critical.

Cheers,
Tom

Regulated Linear Power Supply Construction
What's inside your Astron?
David Metz, WA0AUQ

I have often referenced David Metz's (WA0AUQ) article on Linear Power Supply Construction. David wrote this article for the SouthEast Iowa Technical Society (SEITS) newsletter in November 1996. Sadly, SEITS and its web site are no longer on the Internet.

Kevin Custer, K3KKC has agreed to add this article to the Astron folder in the Repeater Builders Technical Information Page (RBTIP). Hobbyists can again access this informational and educational article on linear power supply construction (Adobe Acrobat format) here:
http://www.repeater-builder.com/astron/seits-astron-article.pdf

w9gb

BTW Meter labeling is also quite easy

==========
The measurements derived from PSU fitted operational meters do not need
to be very accurate.
To make the correct series resistor for the voltmeter and the shunt for
the current meter you need a digital volt/mA meter ,preferably with a
10 Ampere- DC range included.

For both measurements a moving coil meter in the 0.1 -1 mA range will be
fine . For the current meter a say 10 mA full scale meter will be OK.

Try to find moving coil meters with a 0-15/0-20 and 0-50 scale.

You probably will find these at a fleamarket/junksale.

To find the respective full scale current of the respective (mystery)
meters ,take a 1.5 V battery and put the DVM and the meter in series
with a 22 KOhm linear potmeter , adjust potm. until mystery meter reads
full scale and read current on DVM.
Remove DVM from circuit and adjust current again to full scale.
Measure voltage (probably in mV range) across meter.
You now know everything of meter you need incl the meter resistance.

Voltmeter: Calculate series resistor (probably odd value) and use a
fixed resistor or resistors or 1 resistor in series with a suitable
(10 turn) trim pot.
Apply say 10 Volts across system (measured with DVM) and check meter
deflection . If not to your satisfaction ,change fixed resistor or in
case of using a trim pot ,adjust the trimpot.

Ampere meter:
Take approx 1 metre of thick copper wire capable of carrying 50 Ampere
, meaning that at that current its temperature does not get noticeably
above ambient .

Make a current of say 5 Amperes to flow through the wire .
With the DVM determine the length of the wire over which a voltage
developes which is 20-30 % (not critical) higher than 10% of the full
scale voltage across the designated Ampere meter ,assuming its scale is
0-50.
You can now reduce the overall length of the wire shunt accordingly.
Connect the designated meter in series with a (preferably 10 turn) trim

pot ,with a value of the same order of magnitude as the meter resistance, across the shunt and adjust the trimpot such that with a current of 5 Amperes (as measured by the DVM) the now Ampere meter reads 10% of its scale.
Increase the current to say 20 Amperes (as shown by the DVM or any other Ampere meter) The now Ampere meter should read 40% of scale.

I have applied the above with 'junk box' meters to measure voltage and current from 2 solar panels (0-10 A) and a wind generator (0-20 A). Voltmeter reads 0-15V.
The method described is adequate for 'operational' meters . Their uncertainty (accuracy)is better than 3%.

If the meters you have don't have the wanted scale ,you can change the scale by (carefully)glueing a paper scale on top of the existing one . There are a number of free meter scale programs available from the www

You can achieve a lot on 70cm with an HT and a simple field strength
meter. Think matching stubs & shorting bars...

Hi:
Does anyone know where I can get two or preferably four Toko RWRS-T1018Z coils? These are 180uH adjustable coils in a 10K shield can. I want to build the BC band preselector by Joe Carr in the April 1995 issue of Popular Electronics.

Thanks,
Bob

Nominally these are Phillips parts (now NXE or whatever). They use the
'SA' 'NE' etc., for indicating temperature ranges -- I know I've had
trouble finding '602s with one prefix, and no problem with the other.

You did not say what an 8640B is. Signal generator? Transmitter? Power out?

Main thing is to get the "forward" power to read something on the meter (preferably full scale, but even if you get half or quarter scale, then you are able to get a rough idea of usabiltiy of the meter). Then see what it shows on the "reflected" scale. Figure ver roughly if the reflected power is half the forward (regardless of the actual location on the meter scale), then you have about 3:1 SWR. Turn the meter around to get an idea if the diodes (and associated circuitry) are well matched for forward and reflected.

I have used a number of el-cheapo CB SWR meters even up on two meters and they work surprisingly well, even more sensitive than ham SWR meters for VHF-UHF, and not that far off of what the ham SWR meters report, and so are good for handie-talkie measurements. So, yes, you should get useful ball park figures.

Lab-grade RF signal generator, official range from 500 KHz to 1.024
MHz. In practice it's good from 455 KHz up to about 1.2 GHz. Includes
FM, AM, and pulse modulation, with either internal modulation at variable
frequencies and amplitude (AM) or deviation (FM) or external modulation.
Has a very nice 6 1/2 digit counter good up to 1.2 GHz. Output range
is from -130 dBm (100 nanoVolts) to +20 dBm (3 Volts) into 50 Ohms.

It's a _very_ nice piece of gear indeed. You can see a picture of mine
(and other stuff on the workbench) at

<http://mikea.ath.cx/testgear/index.html>.

That's good to hear. I got to thinking about what an MFJ-259 or -269
does, and decided that I only needed a sensitive-enough SWR meter that
would give reasonably accurate readings from 100 MHz to 1.2 GHz, since

I already had the signal source. Of course, the HP 8640B weighs about
40 pounds, and is a good deal less portable than the MFJ products, but
if I can get this working, I'll be able to do things it won't.

>> running the signal through
>> the SWR meter to the antenna? Or am I way off in left field?

Looks like I'm well inside the ballpark and that I have some design
and construction to do. This should be fun.

Thanks!

I don't think using your 8640B as a signal source to read on a wattmeter
is going to cut it. +20 dBm is only 100 mW. Unless you have a
wattmeter that has a 100 mW or so range, you aren't going to get much
needle deflection. The lowest range on my Telewave wattmeter is 5 Watts.

Agreed. I'm looking at some RF log-amp chips from various places and
some RF sensor chips I saw in a construction article I can't locate
right now, so that I can get something useful with signal levels in
the Part-15 range.

I don't know what I'll wind up with, but it'll be interesting. I'll
share when it's soup.

Mike-

I think you are on the right track with the RF log-amps.

Another idea - I understand the MFJ-259 has a standard SWR configuration with a built-in signal source that uses an ALC to keep forward power at the equivalent of full scale. Why not replace the 259 signal source with the HP 8640B?

I hadn't thought of that. I suppose I could put a jack on the 259's
case, and a switch to select the 8640B, which has _marvelous_ ALC all
its own. The switch, and some RG-174, ought to be good enough for what
I'll be asking them to do. But that changes the question to "Is the
259's SWR sensor good enough above 175 MHz, and especially around 33
cm to 25 cm, to give real-world answers?"

I'll never know if I don't try.

I may have to buy a factory UHF-and-above antenna analyzer to validate
my answers, of course. I'm sure W5DNA will understand why we're eating
potato soup for two or three months.

Thanks!

They can be ordered directly from Philips -- as of a couple of years
ago anyway. Also, www.findchips.com shows a few vendors that sell them.

I'd start by measuring a standard or two. You can get pretty decent termination resistors on eBay for a modest cost. If your system measures close to 1:1 when terminated with one of those, you're off to a good start. Next I'd make up a 50 ohm microstrip line terminated with a 50 ohm chip resistor. If that reads close to what the 50 ohm termination did, then I'd measure the SWR with some different load values, say 25 and 100 ohms. These of course could be made from two 50 ohm chip resistors. You could get more elaborate with the calibration by introducing reactive loads, but just the three data points should be enough to give you some confidence in your SWR measurements, at least near 1:1 where your primary interest is.

As the Christmas season draws closer, many of us who have watched
the war in Iraq have wondered how we could help or "make a difference"
to the lives of some of our Soldiers, Sailors, Airmen and Marines who
have been wounded in combat.

Although there are several military hospitals that take in the
wounded, most find their way into Walter Reed Army Hospital.

Please take a minute to fill out a Christmas card and address it as
follows:

A Recovering American Service Member
c/o Walter Reed Army Medical Center
6900 Georgia Avenue, NW
Washington, DC 20307-5001

Perhaps a personal note of thanks and gratitude for the sacrifice
they've made would be appropriate.

As the Christmas season draws closer, many of us who have watched
the war in Iraq have wondered how we could help or "make a difference"
to the lives of some of our Soldiers, Sailors, Airmen and Marines who
have been wounded in combat.

Although there are several military hospitals that take in the
wounded, most find their way into Walter Reed Army Hospital.

Please take a minute to fill out a Christmas card and address it
as
follows:

A Recovering American Service Member
c/o Walter Reed Army Medical Center
6900 Georgia Avenue, NW
Washington, DC 20307-5001

Perhaps a personal note of thanks and gratitude for the sacrifice
they've made would be appropriate.

3 volts into 50 ohms isn't much power. ~3/50 of an amp, means about 180
milliwatts. The most sensitive calibrated SWR meters will read zero to 5
watts full scale, so 180 milliwatts might move your needle for forward power
about 5-10 degrees of arc away from the leftmost peg towards the rightmost
peg on the dial. That doesn't give you much indication of reflected power
since a 3:1 ratio would then mean movement of the needle about 2.5 to 5
degrees of arc, respectively. The elcheapo CB SWR meters _might_ be more
sensitive since more power _should_ transfer to the measuring bars because
2 meters is some 5 times higher in frequency and the CB SWR meters are
meant to operate at max 3-4 watts of RF output from the CB rigs. But,
you'll have to try it.

Hey all,

I'm trying to clean out the parts cabinet. So free shipping on all orders until I say otherwise.

My parts are new, but old stock spurplus. They are not pulls, and they have never been used. Most are gathered at hamfests, and some are gathered from eBay, some from surplus auctions, some just show up.

See the website below for details.

Source record: 9132

All right, I'm hoping someone here can clue me into finding the one(s) I want. What I need is a handbook that has schematics for tube equipment circa the 1960's. I have a boxful of tubes from television sets from that era, and I was hoping I could put together a receiver from some of them. I do have the first volume of Impoverished Radio Experimenter, which talks about using "newer" tubes in older schematics, but the scant few Lindsay talks about aren't among the tubes in my box.

I've found a very good used book search engine, but unless I have a better idea of what to look for, It's going to be hit and miss. Any help would be greatly appreciated.

Ralph

The above link should prove helpful. Future Electronics has a pretty good
selection of Philips components. The only catch is that you have to buy a
rail of 25 at a time. At the price of $2.65 cach, that isn't too bad. When I
buy SA602s, I usually buy 100 at a time. I've got around 100 of the 605s,
but who knows where they are. I put them in a safe place, along with the two
evaluation boards. Unfortunately, it was too safe of a place!
Give Future Electronics a call.....they will be able to help you. If
you can find some friends to split the cost with, that always helps.

Just about any year's Handbook from the 60's would have what you're
looking for. They really didn't change that much from year to year.

But if you're just looking for projects, any of the magazines would
have had plenty, and it's just a matter of picking them from the
right years so they not only use tubes, but of the right vintage
tubes.

And if you can't find old magazines, you can get QST on CDROM, so
a volume of that from the right time period would supply plenty of
projects. Of course, most of the projects in the Handbook came
from QST to begin with, so it's not like you miss much in the project
department.

Of course, a lot of TV sets were AC/DC, so the filament voltages are
all over the map since you'd put them in series to run directly off
the AC line. Unless they start with "6" or "12" the tubes
may not be so useful.

Source record: 9136

Depending on the vintage of the tubes, you might trouble finding data on them.

In the '60s, TV manufacturers made a lot of extra money by changing the tube lineup every year. This required service shops to buy several sets of new tubes every year as replacements. Typically, the innards of the tubes were virtually identical to older ones, but with different pinouts, filament voltages, and combinations of tubes within the envelopes. If your tubes are from this era, you probably won't find them in the Handbook. You might have to get one of the later RCA tube manuals for tube information, then compare specs with various tube types used in Handbook projects to find projects you can build with the tubes you have.

Good luck!

Roy Lewallen, W7EL

==========
Being in series means they would all be used with the same filament
current which can be easily implemented with a circuit employing a 78xx
device in constant current mode (obviously in a DC environment)

I know exactly how you feel. I was interested in ham radio since my early teens. I tried learning the code severel times over the years. There are always those who will say you didn't try hard enough, or you used the wrong method, or you didn't care, or you wern't dedicated enough. There is more to life than studying CW. I'm not a EE but I made a living as a electronic tech for 36 years. In retirement I finally learned enough code to barely pass the test. I went to the testing session prepared to pass the tech test. I got a general class licence from that session. 5 more correct answers and I would have been a extra. Three weeks later I passed the extra test. The elmer who introduced me to amateur radio 40 years ago is probable long dead. It would be nice to tell him I finally made it. I still don't know the multipication tables. The end of CW testing is long overdue. You will be an asset to amateur radio.

5838. Cal. kit for a 4195A & 41951A

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-21 21:36:09 UTC
From: Fred Bartoli <fred._canxxxel_this_bartoli@RemoveThatAlso_free.fr_AndThisToo>

Hi,

Probably a question for Tom, but others are welcomed to answer too :-)

I've finally got my hands on an HP4195A (0-500MHz and freshly caled) and also the 41951A impedance set + 16092A fixture. Unfortunately the 41951A has been badly tempered and the calibration kit (short and 50R load) is missing.
After some time spent I've fixed the 41951A, and seem to have a fully functional unit (checked through calibrating it *with* the 16092A fixture and a pair of selected 100R-0805 as the reference load).
At least the measurements I could do make sense, so far.

Now I'd just like to have all the possible accuracy from this and thus want to rebuild an APC7 cal kit I can trust.

The original parts aren't available anymore, just 2 50R load left at agilent at a (cough) $1350 price! and no more short.

I've found agilent has the 909C load which should be OK (given for SWR=1.005 @ 2GHz).
I've also found an Amphenol short which should be OK since, AIUI, the short is made by compressing a flat piece against the ref plane of the mating connector.

I also want to add to this an APC7-SMA adapter for some on board impedance measurement.

I believe all this would be perfectly OK but since I have not much hands on experience with VNAs I'd just want to make sure.

Oh, last point, for those knowing it: I don't know if the open load (04191-85302)is complete or not (it has an opened threading at the opposite of the mating end) and could I find any picture/doc of it.

Any comment much appreciated.

Bill, I respectfully disagree. Your strategy works with normal people.
Robesin isn't normal, and he'll only go away when his ISP is shut off.
He's the originator of the infamous "MARS >>>IS<<< Amareur Radio"
declaration and the excrement eating thread. At the moment, he's got
himself wrapped up in the flag, so he's untouchable even if off-topic.

Bill...Welcome to the "logic" of Brian P Burke, N0IMD, hiding
behind one of his "anonymous" screen names as "hot--ham-and-cheese"

Brian has participated, along with Leonard H Anderson (unlicensed)
and Mark Morgan (KB9RQZ) in an anti-Amateur Radio tirades and has
fallen flat on his face in one prognostication about Amateur Radio
after another. He doesn't like it that I've been right.

One of Brain's favorite tactics is to take comments out-of-context
and then try to represent them as the entire "gist" of the comments.

My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that
the MARS program was staffed almost entirely by Amateur Radio licensees
and was in the very spirit of what it means to be an Amateur Radio
licensee...He doesn't want to repeat THAT part since it wouldn't serve
his purposes. (to try and embarrass me)

He also claims that I am repsonsible for the "excrement eating"
thread. That's a blatant lie. His "friend", Mark Morgan, KB9RQZ, is
SOLELY RESPONSIBLE for the authorship of those subject lines and use of
profanity. You won't see my subject lines repeating it..

Brain, of course, has NEVER owned up to any one of his own
misrepresentatiuons of Amateur Radio. He has made ludicrous claims
that have failed to meet any statndard of proof or substance, including
any one of several claims of having been a DX station,
misrepresentations about MARS, RACES, ARES, and other poorly
conceptualized opinions that have fallen by the wayside as failing the

test of evidence.

Everyone's entitled to their opinions. Brain's opinions of me are obviously low as he, despite having allegedly been a veteran himself, are anti-veteran and anti-volunteer. I've rubbed his nose in one failed opinion after another.

So...There's my $0.02. Do with it as you will, but I'd take a BIG grain of salt with any traffic coming from "hot-ham-and-cheese", as you are welcome to do with mine.

Andy adds:

That's true as long as the current requirements were the same. For instance, putting a 12V/1amp filament in series with a 12 V/200ma filament will not do well on 24 volts.... Just like putting a 100 watt
and a 7 watt light bulb in series across 220 volts....., (guess which one will be the brightest, and for how long :>)))) ??)

The currents were matched in the 5 tube AC/DC radios, but generally you have to check the filament current rating as well as the filament voltage rating in order to do this..... It ain't rocket surgery, but you can't put tube filaments in series indiscriminately.

You're right, the voltages range anywhere from 3 to 33 volts. Two of
them are 6V6 tubes, so I have some hope there. Most of them are
miniatures, and some of them have the numbers missing, which makes
things really interesting.

Thanks, but I have two problems - I'm stuck using dialup, and most of
these books seem over my head. Interesting, nonetheless.

Well, these should definitely help me identify which tubes are the most
useful, especially the first link. It's a start. I could use some
schematics, though.

6V6 was the quintessential beam power audio output tube of the 1940s through the 1960s. You can generally "read" the missing numbers if there is anything left of the imprint by gently rubbing the tube on your hair. THe oil from your hair will stick to what is left of the printing and make it readable for a short time. You might take a permanent marker if and when you finally read the number and mark the tube.

As has been alluded to in several posts, you are not limited to the exact tube that the original project had in it. For example, the 6U8 was the VHF/UHF RF oscillator/mixer of choice in thousands of designs. However, a 6J6 oscillator with a 6BE6 mixer will work every bit as good if you aren't fussy about VHF reception. There are dozens of tricks you can play with mix & match tube lineups, some better than others.

Unless you pay by the hour, it's doable with dialup. Do it late at
night so there's no disturbances, and hopefully less traffic. Be
selective, figuring out what you might find useful before downloading.

I have dialup, and I grabbed some of those books last year, using
this same method. It took time, but if you plan it right, it doesn't
get in the way. Just don't plan to be able to do much else at the
same time as the download.

Unfortunately, while I did record the times it took to download those
books I did download, I have no idea where I put that list.

Of those books, the 15th edition of THe Radio Handbook is likely
the best choice, since it's the most recent of the handbooks they
have there. Most of the books are more text books, and the 1941 ARRL
Handbook is likely going to use older tubes than you have, same with
the 1940 Radio Handbook.

Another thing that has worked for me is to put the tube in the freezer
for a few hours. Frost forms in a different pattern around where the
number was than on the rest of the envelope. Sometimes.

TJ Linday says as much in the Impoverished Radio Experimenter. Thing
is, he was scant on details. I wrote them about my project, and I'm
hoping they'll have some ideas.

And after you take it out of the cooler, "huff" on it once or twice
(just as people "huff" on their eyeglasses before wiping them with
a cloth) and the moisture from your breath may outline the tube
identification.

Bill, this is the first Robesin reply in years where he did not forge
the attributes to read "snot-scam-and sleaze..." Robesin is trying to
win you over by playing nice this time. Unfortunately, the rest of us
know his game.

> Brian has participated, along with Leonard H Anderson (unlicensed)
> and Mark Morgan (KB9RQZ) in an anti-Amateur Radio tirades and has
> fallen flat on his face in one prognostication about Amateur Radio
> after another. He doesn't like it that I've been right.

Robesin is right? When???

Robesin attacks when I reposted an article taken directly from the ARRL
web site quoting an ARRL Vice President >in its entirety< stating that
amateurs have an overblown sense of self-importance.

> One of Brain's favorite tactics is to take comments out-of-context
> and then try to represent them as the entire "gist" of the comments.

One of Robesin's favorite tactics is to make homosexual inuendo or
claims of pedophilia when he encounters someone who disagrees with him.

> My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that
> the MARS program was staffed almost entirely by Amateur Radio licensees

> and was in the very spirit of what it means to be an Amateur Radio
> licensee...

I pointed out that MARS absolutely has non-amateur leadership, non-amateur participants, and an entirely non-amateur mission. Hell, Robesin claims to have been chopped to an NMC MARS slot on Okinawa - as an active duty, non-amateur participant. Yet he continues with his "Sorry Hans, MARS >>>IS<<< Amateur Radio" nonsense. Didn't even know what the MOD was. He tried pulling this stunt before he realized that I had MARS experience.

> He doesn't want to repeat THAT part since it wouldn't serve
> his purposes. (to try and embarrass me)

Except that I was an actual MARS affiliate and knew what I was talking about. You didn't. Still don't.

> He also claims that I am repsonsible for the "excrement eating"
> thread. That's a blatant lie. His "friend", Mark Morgan, KB9RQZ, is
> SOLELY RESPONSIBLE for the authorship of those subject lines and use of
> profanity. You won't see my subject lines repeating it..

Sorry Robesin, but you are the one who posted the "excrement eating" filth, and keep reposting your quote. Unbelievable, but Google provides.

> Brain, of course, has NEVER owned up to any one of his own
> misrepresentatiuons of Amateur Radio.

I have opinions but Robesin doesn't allow dissenting opinions. Opinions that differ from his are "LIES."

> He has made ludicrous claims
> that have failed to meet any statndard of proof or substance, including
> any one of several claims of having been a DX station,

David Heil/K8MN has me confirmed at least twice. Robesin knows this, therefore Robesin lies.

> misrepresentations about MARS, RACES, ARES, and other poorly
> conceptualized opinions that have fallen by the wayside as failing the
> test of evidence.

After it was obvious from one regular on RRAP that his ARES group was unable to fully support an upcoming American Red Cross exercise, Robesin was asked to write a duty schedule for the exercise. The stated requirements were three 3 operators on duty per shift. He shorted the 1st eight hours of the exercise by all three personnel. He claims it was covered, but the supported agency was not supported at all. The subsequent shifts were shorted from one to two operators per shift. Robesin claims that ARES can support all agency needs even when they lack enough volunteers. Amateur Operators can perform Super-Human feats, OR the ARC is just an 8AM - 5PM agency.

> Everyone's entitled to their opinions.

Not true. Hot-ham is not entitled to an opinion, if Robesin has
anything to say about it.

> Brain's opinions of me are
> obviously low as he, despite having allegedly been a veteran himself,
> are anti-veteran and anti-volunteer.

My opinions of Robesin are spot on.

In addition to slinging accusations of homosexual and pedophilia at
those who disagree with him, I am now a veteran-hater and a
volunteer-hater. Nevermind that I am a veteran and a volunteer.

Robesin has claimed that he can have me picked up on his say so as an
LPN with a simple phone call from Tennessee. To another poster on
RRAP, he claimed that "People who shoot off their mouths can have their
tires slashed, rocks thrown through windows, and wives terrorized," but
later clarified that all those bad things would be at someone else's
hands.

A well known Amateur Radio store advertising in QST, whose ham daughter
was featured in the ad photo, was said to be "selling something" but
not amateur equipment.

Robesin, whose father was a Sailor Army Recruiter (I swear thats not a
typo), lays claim to seven hostile actions in the USMC, but who's only
overseas assignment was Okinawa.

There's more, much more, but if I went on and on and on you'd probably
think I was making it up. I'm not. Google provides.

> I've rubbed his nose in one
> failed opinion after another.

Yet it is your excrement on another man's genitals, according to your
own original claims and subsequent quotes. Google provides, and you've
requoted yourself numerous times.

> So...There's my $0.02. Do with it as you will, but I'd take a BIG
> grain of salt with any traffic coming from "hot-ham-and-cheese", as you
> are welcome to do with mine.
>
> 73
>
> Steve, K4YZ

Your $0.02 isn't worth two cents. Google provides.

Of course let us not leave Mark out of the insanity. Mark will continue to
crap upon as many posts as he can, whether he is asked to join or not.

Mark is far from "normal", too. Billy Smith already knows that....

How complex of a receiver are you looking to build?

There are a PILE of simple tube circuits on
http://www.intio.or.jp/jf10zl/index.html .

Most of them use Japanese tubes (the site is in Japan, after all<g>) but
I would suggest in many cases you can figure out what U.S. tubes are
similar.

William,
He's probably looking for the "bare" ones from that era. They look like a flat block of phenolic with contacts riveted to each end.

Playthings of Past has boxes of them, used. (I drooled over many of the chassis that they came from). There may even be some NOS ones available. Many of those caps were punch stamped with the value on the metal ends, sadly many were stamped in ink on the phenolic that faded completely over the years. You might try contacting Gary Schneider (PTOP) to get the sizes you need. Check the website first to see if they are listed. www.oldradioparts.com.

This is not to be confused with Mark Oppats site, www.oldradioparts.net. Both are very valuable resources for vintage radio parts. Gary has always leaned toward battery set parts, power transformers, and other hard to find OEM items. Mark is, of course, The King of Kontrols,... and capacitors, ...and dials, and... Bookmark both links and you'll have many of your radio parts needs right there at hand.

Best of luck on your project.

Not true, Brain...Not true. However you go right on ahead with
your tale of woe.

> Robesin is trying to
> win you over by playing nice this time. Unfortunately, the rest of us
> know his game.

Robeson DOES "play nice"...Unless you blatantly lie to me or get
caught lying about something that you should know better than to lie
about.

For example: Brian P Burke promising to keep certain information
"private" via e-mail, but then running right on back to the NG and
divulging that which he promised to not divulge.

Hence the complete lack of respect for Brian P Burke.
>
> > Brian has participated, along with Leonard H Anderson (unlicensed)

```

> > after another. He doesn't like it that I've been right.
>
> Robesin is right? When???

Let's start off with YOUR assertions that ARES.RACES, etc couldn't
/ wouldn't respond to any major disaster in any meaningful numbrs or
for a sustained period.

I said you were wrong.

You said several nasty things about "uniforms", "patriotic
bunting", "ARRL sockpuppet", etc [words, by the way, straight out of
the Leonard H Anderson playbook].

Then came a series of hurricaines and tornaos to the south and
southwest. All of them supported at length by ARES and RACES (among
others, of course)

Then came September 11th...Then came Hurricane Katrina...Then came
Hurricaine Rita...Again, all agencies YOU claimed couldn't / wouldn't
respond did exactly that.

We can then dig up your "unlicensed devices" rants, among others.

> Robesin attacks when I reposted an article taken directly from the ARRL
> web site quoting an ARRL Vice President >in its entirety< stating that
> amateurs have an overblown sense of self-importance.

And it wasn't true then, it's not true now.

The ARRL vice president's sentiments are NOT shared by the
Department of Homeleand Security, the Department of Defense, Salvation
Army, The American Red Cross, the Department of State and other
agencies.

> > One of Brain's favorite tactics is to take comments out-of-context
> > and then try to represent them as the entire "gist" of the comments.
>
> One of Robesin's favorite tactics is to make homosexual inuendo or
> claims of pedophilia when he encounters someone who disagrees with him.

Only true when there is such evidence of that sort of behaviour,
Brain.

So far it's hit the mark (pradon the pun) with Mark and Toiddie.
The jury's out on you, but you cleaned up your act.

> > My "MARS >>>IS<<< AMATEUR RADIO" comment refered to the fact that
> > the MARS program was staffed almost entirely by Amateur Radio licensees
> > and was in the very spirit of what it means to be an Amateur Radio
> > licensee...
>
> I pointed out that MARS absolutely has non-amateur leadership,

Uhn huh.

And over 95% of Amateur Radio >>>IS<<< staffed by licensed Amateur
Radio operators.

> Hell,
> Robesin claims to have been chopped to an NMC MARS slot on Okinawa - as
> an active duty, non-amateur participant. Yet he continues with his
> "Sorry Hans, MARS >>>IS<<< Amateur Radio" nonsense. Didn't even know
> what the MOD was. He tried pulling this stunt before he realized that
> I had MARS experience.

Yes, Brain, I know what the MOD is. You've allowed yourself to be
hypontized by Lennie's incessant repeating of that claim.

It was wrong then. It's wrong now.

> > He doesn't want to repeat THAT part since it wouldn't serve
> > his purposes. (to try and embarrass me)
>
> Except that I was an actual MARS affiliate and knew what I was talking
> about. You didn't. Still don't.

Brian P Burke uttering yet again more mistruthful statements in a
public forum.

> > He also claims that I am repsonsible for the "excrement eating"
> > thread. That's a blatant lie. His "friend", Mark Morgan, KB9RQZ, is
> > SOLELY RESPONSIBLE for the authorship of those subject lines and use of

> Sorry Robesin, but you are the one who posted the "excrement eating"
> filth, and keep reposting your quote. Unbelievable, but Google
> provides.

Sorry, brain, but one again YOU are lying.

The "excrement eating" posts belong to your "buddy", KB9RQZ. And
the recent onslaught of re-tasked subject lines with exactly those
words are HIS doings...Not mine.

Stop lying, Mr Burke.

> > Brain, of course, has NEVER owned up to any one of his own
> > misrepresentatiuons of Amateur Radio.
>
> I have opinions but Robesin doesn't allow dissenting opinions.

> they lack enough volunteers. Amateur Operators can perform Super-Human
> feats, OR the ARC is just an 8AM - 5PM agency.

Sigh.

I guess we can only watch Brain continue to make a fool out of
himself.

> > Everyone's entitled to their opinions.
>
> Not true. Hot-ham is not entitled to an opinion, if Robesin has
> anything to say about it.

Sure. Have an opinion.

But when you express it as "fact" and the "facts" don't bear up
under the scrutiny of 3rd party reports to the contrary, don't get
upset when you get "called" for your errors, Brain.

> > Brain's opinions of me are
> > obviously low as he, despite having allegedly been a veteran himself,
> > are anti-veteran and anti-volunteer.
>
> My opinions of Robesin are spot on.

Uhhhhhh...YOUR spots are usually little yellow rings on the carpet,
Brain.

> In addition to slinging accusations of homosexual and pedophilia at
> those who disagree with him, I am now a veteran-hater and a
> volunteer-hater. Nevermind that I am a veteran and a volunteer.

You hated them before, Brain...I am sure I am only the focus of
your disdain in THIS forum.

You've not had a single constructive, complimentary thing to say
about ANY volunteer group save your Scouting troop.

> Robesin has claimed that he can have me picked up on his say so as an
> LPN with a simple phone call from Tennessee. To another poster on
> RRAP, he claimed that "People who shoot off their mouths can have their
> tires slashed, rocks thrown through windows, and wives terrorized," but
> later clarified that all those bad things would be at someone else's
> hands.

Bigger sigh.

More of Brian P Burke's misquoting. I cited a news item some
years ago where exactly that thing occcured.

Now for having mentioned it, Brain insists that I have made thinly
veiled threats of a same nature.

An act of cowardice.

> A well known Amateur Radio store advertising in QST, whose ham daughter
> was featured in the ad photo, was said to be "selling something" but
> not amateur equipment.

More deceit.

Brain...WHY do you lie so readily?

> Robesin, whose father was a Sailor Army Recruiter (I swear thats not a
> typo), lays claim to seven hostile actions in the USMC, but who's only
> overseas assignment was Okinawa.

"Sailor Army Recruiter"...?!?!?

No Brain...let's get the FACTS right. My father served on Active
Duty in the Untied States Navy during the Korean Conflict.

He was later an Active Duty recuriter for the US Army Reserve.
Yes, Brain, SOME people DO serve in more than one branch of the Armed
Forces than one...

And no, Brain, Okinawa was NOT my "only overseas assignment".

> There's more, much more, but if I went on and on and on you'd probably
> think I was making it up. I'm not. Google provides.

Much of what you say is not "made up"...Just quoted out of context
or misattributed.

But mostly quoted out of context.

> > I've rubbed his nose in one
> > failed opinion after another.
>

> Yet it is your excrement on another man's genitals, according to your
> own original claims and subsequent quotes. Google provides, and you've
> requoted yourself numerous times.

I guess your English comprehension skills are as incompetent as
Morkie's.

That's not what I said. But you go right on ahead pretending it
is as long s you think no one else can see it....

> > So...There's my $0.02. Do with it as you will, but I'd take a BIG
> > grain of salt with any traffic coming from "hot-ham-and-cheese", as you

> Your $0.02 isn't worth two cents. Google provides.

Google provides evidence that any "opinions" uttered by you under
any one of your "anonymous" names needs to be taken with a grin of salt
the size of the Rock of Gibralter.

As usual.....

Steve, K4YZ

Does Robesin always start off with a lie? Apparently so.

In any event, I changed his forgings back to the original content.

> > Robesin is trying to
> > win you over by playing nice this time. Unfortunately, the rest of us
> > know his game.
>
> Robeson DOES "play nice"...

Do I have to start another tally of your lies such as I had to do a few
years back? What was it? An average of 10 new lies a day for a week
before I gave up?

> Unless you blatantly lie to me or get
> caught lying about something that you should know better than to lie
> about.

No lies, Robesin. You just don't like my opinions.

> For example: Brian P Burke promising to keep certain information
> "private" via e-mail, but then running right on back to the NG and
> divulging that which he promised to not divulge.

There was no promise, and what you claim was a hostile action was
nonsense.

> Hence the complete lack of respect for Brian.

Robesin has six other hostile actions. He says.

> > > Brian has participated, along with Leonard H Anderson (unlicensed)
> > > and Mark Morgan (KB9RQZ) in an anti-Amateur Radio tirades and has

But that's not what I said. It's what you said I said.

> You said several nasty things about "uniforms", "patriotic
> bunting", "ARRL sockpuppet", etc [words, by the way, straight out of
> the Leonard H Anderson playbook].

I don't use the phrase "sock puppet" or "ARRL sock puppet." I don't
think I've ever used the phrase "patriotic bunting," either. I do use
the word "uniforms" as in Robesin will do anything to get into a
uniform since his USMC career was cut short by some unmentionable
mystery.

Perhaps why Robesin claims that my statements are straight out of the
Anderson playbook is because Robesin is unable to distinguish a Hot-Ham
posting from an Anderson posting. His stupidity is not my problem, but
he tries to make it so.

> Then came a series of hurricaines and tornaos to the south and
> southwest. All of them supported at length by ARES and RACES (among
> others, of course)

Do all amateurs have super-human abilities in Robesin-world?

ARES is a volunteer organization. It suffers from shortages of
manpower and equipment just as do non-volunteer response organizations

during an emergency.

> Then came September 11th...Then came Hurricane Katrina...Then came
> Hurricaine Rita...Again, all agencies YOU claimed couldn't / wouldn't
> respond did exactly that.

Only Amateur Radio responded with exactly enough of everything?

Lots of agencies responded. Lots of News Reports about too little, too late. Lots of Government Officials claiming too little, too late. Lots of Citizen Victims claiming too little, too late. I don't know how Robesin missed it, unless he was busy with that 1,000 yard stare.

> We can then dig up your "unlicensed devices" rants, among others.

No rant. Unlicensed devices and cell phones handle most day to day emergencies.

> > Robesin attacks when I reposted an article taken directly from the ARRL

tactics.

> Stop lying, Mr.

You originated the excrement eating posting, and you have since
requoted yourself for the sake of clarity, however, what you said was
far from clear. If you'd like to restate what it was that you said,
hopefully in a clearer way...

No, nevermind. It was sick enough the first time it came around.

> > > Brain, of course, has NEVER owned up to any one of his own

>
> Sure. Have an opinion.
>
> But when you express it as "fact" and the "facts" don't bear up
> under the scrutiny of 3rd party reports to the contrary, don't get
> upset when you get "called" for your errors, Brain.

You post in absolutes..., for example, "Sorry Hans, MARS >>>IS<<<
Amateur Radio."

I pointed out that the Chief of Air Force MARS, at the time, was not an
amateur radio operator.

That single fact sunk your whole position on MARS as an amateur
organization, unless you want to argue the definition of "is."

> > > Brain's opinions of me are

> > volunteer-hater. Nevermind that I am a veteran and a volunteer.
>
> You hated them before, Brain...I am sure I am only the focus of
> your disdain in THIS forum.

Nope. You bring disdain upon yourself in your behavio[u]r toward
others.

> You've not had a single constructive, complimentary thing to say
> about ANY volunteer group save your Scouting troop.

My comments were about people who are volunteers of multiple volunteer
agencies, and when a crisis occurs, have to support one agency and not
all. For example, you are a "professional" volunteer, committing to
the Tennessee State Militia, the Civil Air Patrol, ARES, MARS, and who
knows what else. And your professional position as an ER LPN should be
a high priority in your community. So when the claxon goes off, which
way do you run? Which volunteer organization(s) are left holding the
bag because Robesin overcommitted himself and really isn't super-human?

> > Robesin has claimed that he can have me picked up on his say so as an

>
> Bigger sigh.

Yeh. Big, big sigh. Maybe if you just quit posting such nonsense....

> More of Brian's misquoting. I cited a news item some
> years ago where exactly that thing occcured.

Here's a hint, next time you cite a news item, present it as a cited
news item and not as a threat. It's called "clarity," and you lack it.

> Now for having mentioned it, Brain insists that I have made thinly
> veiled threats of a same nature.
>
> An act of cowardice.

I perceived a threat. In Robesin's own words, one has only to perceive
a threat for there to be a threat.

> > A well known Amateur Radio store advertising in QST, whose ham daughter

What scares me most isn't that you made a mistake in your grammar when
posting that sick nonsense, it's that you posted the sick nonsense at
all.

It is grossly off topic and has no place in an amateur radio discussion
newsgroup.

I certainly hope that Paul Schleck agrees.

> > > So...There's my $0.02. Do with it as you will, but I'd take a BIG

5874. Ideal ham receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-23 15:40:52 UTC
From: jimspeer@jimspeer.org
Message-ID: <1166888452.256055.166010@48g2000cwx.googlegroups.com>
Source record: 9025

I don't much like the receivers I've used in contemporary tranceivers -- the general coverage synthisized open front end ones. (I hasten to add I haven't used any of the $4000 rigs; can't afford them). But the ones I have used seem plagued with near-signal desensitization, front end overload, etc., and I suppose all that comes from putting the selectivity so far downstream.

I'm almost tempted to get an old 75s4 and shut up, but I really don't need another room heater, so, instead, I'm thinking of building my own receiver along the lines laid down by the late Doug DeMaw in his _QRP Notebook_. Single conversion 160m superhet with Collins mechanical filters in the IF and a series of down-converters for the other bands. Anybody got any experience with the DeMaw Design?

Jim, K5YUT

I think the main issue with the contemporary transceivers is covering DC to daylight and trying to make the thing work. A single band design seems to be a lot easier to make bulletproof.

Modern QRP design has advanced a lot since the DeMaw days, even over the venerable 75s4. Take a look at designs by K8IQY or AD6A or N7VE and you will find receivers that will be head and shoulders beyond anything that W1FB ever dreamed of.

The front end overload issues on simple receivers seems to be largely related to the use of the 602/612 mixer. The passive mixer, or Tayloe mixer, designs seem to fare much better. The Elecraft K1 is the exception that proves the rule; I suspect careful gain management may have something to do with that.

KK7B has also written a LOT on receiver design, and his designs have a good rep, but I've never used them so I can't comment from experience.

Doug's designs are fun, and sort of nostalgic, but if you are looking for 21st century performance, it isn't the place to look.

..

There are many variations on this theme. There are two camps here,
the Collins version was a 160 meter first IF with a 455 khz second if.
The Drake version was an 80 meter first IF with a second if of 455 khz,
and a third if of 50 khz. So you have the 75S series vs the 2B series.

Lafayette radio's famous HA350 used the 2B method as did a home brew rig
in the '67 handbook (both without the 50 khz if, they used a Collins
filter.)

I've been thinking of building something along these lines to make use
of some 85 khz ARC-5 IF cans in the junk box. You'll get somewhat
better image rejection above 20 meters if you use an 80 meter IF instead
of 160, but otherwise either IF scheme is ok.

Yet another idea is a single conversion with a 9mhz IF. Since I have a
bunch of surplus 9mhz filters (they are 8 pole units with 3.2 khz
bandwidth) I was also thinking of a rig with these. True the filters
are a bit wider than common today, but if I put THREE of them in cascade
(between IF stages) they should do a good job. I would use a DDS VFO,
but would also used a tuned (not broadband) front end. I have enough
toroids and multi section variable caps in the junk box for that. I
also have some old tv turret tuners that would make a good band switch
for the front end (put the toroids on the tuner strips). I have lots of
J310 fets, so I'd use them in the front end as well.

Try Drake R4B and Softrock tuned to the first IF 5645 (?) you will get best
of both worlds. Switching before and after filters gives more options.

> Jim, K5YUT
>
But then you're just recreating something that is open to problems.

That sort of scheme was used to get a constant tuning range over each band,
and because synthesis wasn't easily applied.

But on anything other than the core band, you've got double conversion that
moves the selectiving past two mixers. And unlike current up-conversion
schemes, there is not even a crystal filter of some sort at the output of
the first mixer.

Switch to an IF in the HF range, and you immediately eliminate most image
problems. No fussing over the front end about that, and of course, you
won't have to have the front end tracking the tuning oscillator.

Remember, a whole wave of amateur transceivers and receivers went
to that sort of scheme. And unlike general coverage receivers, you
don't have to worry about any problems due to the IF being in the tuning
range, and you can think up various schemes to do the tuning since you
don't have to cover the 30MHz.

YOu can stick with the modular theme, and thus build only for the
bands you want or even build a band at a time. But instead of a whole
converter, you'd have the preselector circuitry (and maybe an RF stage) and
the variable oscillator for each band. Or build a good receiver up till
the input of the mixer, and then figure out what comes next.

IN the sixties, that wave of single conversion to IFs in the MHz range
used various schemes to deal with the local oscillator. Obviously some
bands needed a frequency range that could easily be supplied by a variable

oscillator without drift (and some of the rigs took that to the extreme and used the variable oscillator directly on 10metres). The problem with bandswitching the oscillator would of course be the issue of getting it to tune only 500KHz or so on each band (and any stability issues caused by the switching of the LC circuits).

Other rigs used pre-mixing, so the variable oscillator would always tune a fixed range, but it would be converted to the needed frequency with a mixer and crystal oscillator. One does have to watch out for spurs on the output, but it gets the extra mixer out of the signal path, and given a relative handful of 500KHz ham bands in the shortwave region, the cost of the crystals wasn't out of range (though maybe today..).

Then later, some rigs used PLLs. I can't remember if the Signal One used one, but certainly in the seventies they came along. Same basic idea as the premixer, but the PLL was the filter so the VCO directly fed the receiver's first mixer.

Rigs like the TS830S used a PLL for that same purpose, though they came up with a pretty fancy scheme to limit the number of crystals needed.

One of the things about receiver design is that the trends have often reflected limitations of the times. There may be a good reasons for doing things a certain way (such as adding a third conversion to a receiver so the BFO is on a different frequency from the one where the main gain is), but it may also mean they couldn't do anything better at the time.

Michael VE2BVW

Well the CX-7 didn't use a PLL, but the CX-11 did. It was however only for generating a comb frequency to be used with premixing. The analog PTO's still tuned 3.1 to 4.1 MHz.

The main problem with up conversion is the hit you take on oscillator phase noise. These days, with the advent of the "H" mode mixer, oscillator phase noise and birdies are THE limiting factor in receiver compromise.

Well, after much hair pulling and gnashing of teeth, I managed to download the 15th edition of Radio Handbook last night. No straight receivers that use tubes, though. Going to have to look at the math section to see if there's some way I can work up a schematic of my own. Thing is, math isn't my strong suit.

Also going to have a look at some of the older books. If worse comes to worst, I know of a few places online where I can buy the tube that are in the schematics I do have.

Ralph

Nothing too complex, two tubes or so. What I want to build is something
that looks like it's from a 1950's Cold War era post apocalyptic story.
I definitely want to use tubes, and I have some headphones from that
era as well. The receiver has to be able to drive the headphones. They
are NOT crystal headphones.

I've heard that DDS units do NOT have the phase noise problem that
conventional oscillators do. DDS does generate spurs, but if you can
find a DDS that will allow for a clock rate many times the desired
output frequency the spurs a far out of band. The Analog devices AD9954
family of DDS chips have a max clock rate of 400 mhz. If you do NOT use
the on board PLL multiplier and clock it externally from a good low
noise clock, you can overclock these chips to as much as 600 mhz!
So if you up convert to 70mhz you'd need a 100 mhz local oscillator at
10 meters. Thats 1/4 the clock (or 1/6 if over clocked).
With a 45 mhz first IF even better.

BTW I had an idea for a rig up converting to 6 meters as the first IF.
This would be dual conversion on the HF bands, though a crystal filter
at 6 meters for a fixed first IF would not be impossible here.

I don't recall the url but I remember a 2-3 tube receiver from the 40's
that might be what you want. It was a simple superhet with a
regenerative detector. Used a 6k8 as the converter and a 6c8g as the
detector / audio. It drove a pair of magnetic phones. The set used two
plugin coils, one for the antenna circuit and one for the oscillator.
Each antenna coil served double duty as the oscillator coil on the next
higher band (moved the antenna coil from the antenna coil socket to the
oscillator coil socket and put a new coil in the antenna coil socket to
change bands). There is a variation that added a 6sj7 as the detector
and the other half of the 6c8 became a bfo.

This first appeared in Feb 1941 QST. The details are on the web someplace, google for it.

I recall reading that the SA602/605's were discontinued and replaced by
the '612/'615. Because of demand some of these were relabeled and sold
as 602/605's to satisfy customers who didn't believe that the parts were
interchangeable. They are.

Don't need anything right now, but I'm bookmarking your web site for
future reference. Even with shipping your seem reasonable.

If you hadn't noticed, Mark is "Out-Assholing" Robesin. He's doing a
damned fine job of it, too.

> Mark is far from "normal", too. Billy Smith already knows that....

Everyone has issues, but there's no need for Robesin to scour the
internet and bring stuff back to RRAP that has no place on RRAP. But
thanks for asking.

> Thanks anyway.

I would suggest this one (http://www.intio.or.jp/jf10zl/17ew8.htm)
would be a good starting point. It should work with most standard
double-triodes (12AX7, 12AT7, 12AU7, 12SN7, etc.) or two single triodes.
(6C4, 6J5, etc.).

This one (http://www.intio.or.jp/jf10zl/12au70v1.htm) could also be
adapted - use more than 12 volts on the plates and put a ~5k:8-ohm
transformer in the plate of the second tube (instead of the R-C network)
and it should do what you're trying to do.

They were called "supergainers" and apparently Frank Jones, of later
VHF fame, was a big proponent of them in the thirties.

The earlier Radio Handbook on that webpage someone posted about would
have them, the 1936 version or whatever. I didn't suggest downloading
that one since I had the impression the tubes available to the original
poster were miniature, and the book predates those.

Thanks, Mike, Ken. I'll have to take a look. I did manage to download
some of the files on designing circuits with tubes, and with the online
tube manuals I might be able to figure out something on my own. Still,
if anyone can think of where I can find something already made up that
I can use, I'd appreciate it.

Ralph

Oh, nearly forgot....
With a little head scratching, you can replace the 6K8 with a 6u8, 6ea8,
6x8 (etc) triode/pentode. Use the pentode as the mixer and the triode
as the oscillator. In many cases the inter-electrode capacitance inside
the tube will provide enough coupling from the oscillator to the mixer,
but you might need to use a gimick capacitor (twisted wires) from the
pentode grid to the oscillator plate. Other tricks are to connect the
pentode screen to the oscillator plate, or in the case of the 6x8, the
pentode grid 3 to the oscillator grid.

The 6c8 may be replaced by ANY dual triode (such as 12au7, 12at7, 12ax7,
6sn7,6sl7, etc....)

The DeMaw designs are very nice but with their band-wide converters they also suffer from having selectivity downstream rather than at the front. Preselection at the front helps with any of these.

The modern choice of a 45MHz or so first IF is really pretty nifty for a general coverage receiver from the past couple of decades. Lack of preselection can be largely cleared up by bolting something before the front end, and indeed many of the receivers you see that cost as much as a car have tracking preselectors.

But if you don't want to upconvert, as I see it you have two choices:

1. Don't even try bandswitching. Coil sets for each band. You end up with the HBR-16, a very elegant and homebrewable receiver.

2. Do bandswitching but with elaborate tracking front end (and if necessary a tracking IF, but with modern synthesizers you probably wouldn't), probably with many switching sections to handle the required octaves. You end up with a R-390A.

Tim.

One reason there was that phase with a separate converter per band ahead of a receiver tuning a fixed band was to avoid switching tuned circuits. By that time, the semiconductors cost so little that it was easier to duplicate them for each band, and then the bandswitching becomes so much easier. No fussing about getting close to the tuned circuits, you simply switch the "B+" and the input and/or outputs. Or, make those converters plug in, and then no switches required at all.

I sort of alluded to this in an earlier post. Make a good receiver, minus the variable oscillator and the front end tuning. Maybe even put the mixer in the "plugins". Then you end up with a good receiver that is quite flexible, because the things that you may want to play with and may give trouble are in a separate box or plugins.

YOu can even play with things like tuneable frontends versus something that is broadband across a ham band. Some bands might interest the builder more than others, so they could build a really good plugin front end for that band, and lesser front ends for other bands, or leave off the bands they aren't interested in (but those bands can easily be added later, unlike a bandswitched rig).

IN the sixties, there was a guy who had a whole slew of receivers described in CQ. Virtually all of them were single bands, and he made the point that it left off bandswitching, and of course he could choose an IF that better matches the tuning range. Good points, but an awful lot of duplication. Build a good receiver first, and then play with the frontends endlessly.

I think we may be in business, here. Went through my selection of tubes, and there's a 6X8 and a 12AX7A among them. Three other tubes looked like they had promise - two 12AV6 and a 6BU6.

After I'm done with this post, I'm going to Google Images to see if I do indeed have 2000 ohm headphones. I want to make sure, because elsewhere I found a crystal shortwave radio that uses them as well. That might serve my needs better, although it won't have those cool glow in the dark tubes.

Ralph

5903. Re: Older ARRL Handbooks

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-25 14:49:46 UTC

Source record: 9054

After using Google images to track down pictures of 2000 ohm headphones, I am satisfied that those are what I have. (Eight sets, in fact.) Found out the one tube is a 6BJ6, not a 6BU6, but it does still seem usable. Going to ask if I can make some trades with tubesandmore, so I can find a good home for some of the headphones and possibly get the tube sockets and transformers I need for my project.

Thanks again to everyone who has helped. Time for me to go do some math. (Ugh!)

Today, I am reminded that Google is my friend. After much digging and prodding, I found what I was looking for. It seems the National SW-54 receiver is as close to what I want as possible without me having to do math. It dates back to the 50's, uses tubes, (in fact, I already have three of the five in it) covers a good amount of the SW band, and will drive either my 2000 ohm headphones or a 4" speaker. BAMA had the manual, but it wouldn't give it up, so I had to go to the mirror site to get it. Everything I need is in it - schematics, parts list, pictures of the assembled receiver. Not exactly the ideal radio for a first try, but nothing good ever came easy, did it? ;-)

Thanks again to everyone who offered advice and suggestions. I'll be sure to post when I have it together and let everyone know how I made out.

Time to scrounge for parts.

Ralph

I'm partial to KK7B's stuff, since the less you mess with the
signal turning it from RF to audio, the better it sounds.
And if you *want* to mess with it, you've got a better
place to start.

My best shack receiver is a Harris RF-590. A genuine
professional military/industrial/spook radio, rack mounted,
weighs a ton, megabucks new, but reasonable if you can
get one surplus. If you can't hear it on this radio, you don't
need to hear it.

You can just measure the resistance of the phones with an ohm meter.
The result will be close enough to the impedance (I think in the era
they were made they didn't even measure impedance, just the resistance).

Also, I have a lot's used 12au7's. If you need a few you can have some
for the cost of postage.

Ocean State electronics has EXACT replacement coil forms for the beast.
(sockets are another story!) They have NORMAL socket type plug in coil
forms too. (the national coil forms have different pin spacing than
standard tube socket type coils).

OPPS, I confused the sw-54 with the sw3-5 series.
This one is a "modern" superhet. Do you have the IF transformers, band
switch and coils?

I have a complete band switch and coil assembly from an old Lafayette
short wave receiver. It is a 4 band assembly with rf, osc, and mixer
coils intended for use with a 3 gang 365pf/section tuning capacitor.
I was thinking of using this in some project (that never happened), but
it sounds like just what you want. The coils have slug tuned tracking
adjustments, and the oscillator and mixer coils also have trimmer
capacitor tracking too.

If you can use this let me know.

PS, if you use this you'll have to change the tube lineup to take full
advantage of all the coils. Replace the 50c5 with a 35c5 and add
another 12ba6 for an rf amplifier. Actually you should use all 6v tubes
and a power transformer. Those AC/DC sets are "undertakers labs"
approved shock hazards. An "isolation transformer will fix that of course."

The schematic of the receiver the coil switch assembly came from is here
http://bama.edebris.com/manuals/lafayett/ha700/

I'm starting to think I should just settle for that crystal shortwave set I found on the Antique Radio website. Less headaches.

No idea where to get the coils for the SW-54, so I guess that's out. Besides, since this is my first real attempt at making a radio, I should probably go for something simpler.

Going back to Google to see if I can find more on some of the tubes I have. I keep thinking I should be able to make a regenerative receiver with some amplification with the two 12AV6 tubes I have.

Huh?

I've seen this exact reply to many posts on many ham newsgroups. If you disagree with the post, aren't you providing a "reply" to these "supposed" spammers? I think you're being a bit anal here. Most people with repeaters (even commercially made ones) have to do a bit of homebrewing to get them on the ham bands (controllers, id'ers, etc.). It sounds like what you want is more specific newsgroups such as rec.radio.amateur.homebrew.vhf.2M.repeaters.motorola.msr2000.boards.replacement.PA.version B

Lighten up. You don't HAVE to read these posts and this one had a very clear subject right in the subject line.

As a side note, which amateur newsgroup do YOU think they should post this to...rec.radio.amateur.swap ??? I haven't read that newsgroup in many months (and I'm still subscribed to it) because there have been no posts there. If I was looking for a replacement part, I'd want to post somewhere where it had a good chance of being seen.

Jim,

I recently went through what you are now doing. Get a copy of EMRFD and read through it.

I built up a DDS vfo that I could use from a few khz up to about 20mhz. I put it in a well shielded enclosure to minimize spur pickup. The one I built also has an lcd readout and keeping that in the shielded enclosure keeps noise down in the rest of the receiver.

I then built up front end bandpass filters for just the ham bands and worked with them till I was happy with their performance.

I then picked up surplus crystals off of ebay. Get 100 of the same kind if you can. The hc49 units I got seem to work well. Then build up the crystal filters you need and get them working.

I then built up an IF using a 1496 ic and the crystal filter.

Then I built up a mini-circuit sbl1 mixer and started hooking things together. The mixer needs a good diplexer arrangement to do its best. I spent some time getting that built up. I learned quite a bit about interstage impedance matching. I used iron core toroid transformers to do most of that (e.g. btwn the mixer and filter and btwn the filter and the IF amp.

Add in a simple product detector and a *good* audio stage and you are all set.

The receiver hears at least as well as my icom 751a. It doesn't have passband tuning (and likely won't) or a notch filter (I have plans to add an audio notch filter) so it isn't quite as good in a crowded situation.

But it *is* simple and easy to work on.

Oh, I almost forgot. I wound up building up an RF amplifier to enhance the receivers sensitivity and added a switchable 20db pad to help with overload situations. I also used a set of latch relays to control everything with a whole bunch of pushbutton switches on the front panel. The relays were expensive but work really well.

Anyway, I think you can build a single conversion receiver that will be quite adequate even compared to todays equipment. Give it a try!

There is no "rec.radio.amateur.swap" It's rec.radio.swap

The original post went to:
alt.ham-radio.marketplace
rec.radio.amateur.boatanchors
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
The first is the only one where it really belongs. Maybe .boatanchors,
since when they created it they allowed for ad, though the intent was
not a general buy and sell newsgroup and neither was it truly meant
as simply a buy and sell newsgroup for boatanchors. It was meant
as incidental to the discussion of boatanchors, so people having
discussion might post ads, as opposed to people who merely use
the newsgroup to buy things.

rec.radio.amateur.equipment is for the discussion of amateur radio
equipment, and was never intended as a buy and sell newsgroup. The
fact that bozos post their ads is not relevant to what the newsgroup
is about.

Same with rec.radio.amateur.homebrew If anything, ads are even
way further off topic, given this newsgroup is about building.

And you're notion that "If I was looking for a replacement part, I'd want
to post somewhere where it had a good chance of being seen." is precisely
why we see so much cross-posting. People who can't figure out where
their post belongs hits all kinds of newsgroups in the hopes
that someone will see it and they'll get a reply. It make no
difference whether someone is buying or selling something, or it's
those silly feud posts; they've all decided that what they want is
more important than what others want. That's the very notion of spam,
hitting lots of newsgroups (or email) in the hopes of getting a response.

People too often are misled by commercial advertising. We see it
on broadcast radio, in the newspapers, and on tv, so it becomes
acceptable. But what's missing is that advertisers in old media

pay for their bandwidth, that they help to deliver the content. That is never the case when someone hits the newsgroups or email. All they pay is for their internet access, and the newsgroups and email would survive without them. So the acceptance of advertising in old media is no excuse for advertising/spam where it doesn't belong in the newsgroups.

------------ REPLY FOLLOWS ------------

Wanting to buy a spare circuit board has to do with repairing, not
homebrewing. Homebrewing means building a new piece of equipment
essentially from scratch.

Source record: 9071

Name: Kirill
Call: VE3AXC

Merry Christmas and Happy New Year everyone! I will be a subscriber of this forum from now on, so nice meeting everybody!

On this note, please allow me to stray a bit off this forum's topic but my info might still be relevant for some. I myself have been a ham for 8 years; also run a small QSL card printing business (my printishop is located in Toronto, Canada) and have a web site specifically dedicated to that www.qslcanada.com

Reason I would like to post this message on this forum is to let your group know that I have a pretty good group referral discount program.

The idea is quite simple and there is no catch.... For each HAM who is referred by you and who wishes to place an minimum order of 500 cards, you would receive 100 (custom designed) cards of the same type free of charge. The offer is transferable, so if for example you let me know that you don't need any more cards, I will be happy to print additional 100 cards for your friend free of charge (or charge for 100 cards less)

This offer may be ideal for your group or a club you belong to. For example, if you
refer say 3 HAMs who would like to print a minimum 500 cards for themselves, you would receive 300 cards as appreciation for spreading the word about qslcanada
; you could transfer it to someone as a gift ; or each of 3 Hams would only pay
for 400 cards, since each one will get 100 cards free. To sum it up, each of the referral counts as 100 free cards in any shape or form. Pse let me know if you have any questions.

So if bunch of Hams in this group who are into QSLing might be interested to giving someone a free gift or getting a good deal on the next batch, pse let me know. The offer is valid any time in future. www.qslcanada.com has quite a bit of samples, more info and e-ham reviews

PS Have got to mention this, since it did happen before, where some folks took this posting too personally. I just wanted to get this info out there ONE TIME ONLY! Please don't call me any spammer names or hate mail me. I believe this to be a fair group offer any hams by hams enterprise deserves a little exposure to start out with.

I will try to participate in this group from now on; best 73 to everyone and Happy New Year!

Managed to find a regenerative receiver based on the 12AT7 tube. I've been told I can substitute one of my 12AV6 tubes without a problem, so that looks promising.

I have some twin triode tubes, as well. (6FQ7, 6BZ7 and 4BC8) I've been wondering if I couldn't make some one tube receivers with them. (Use one triode for regeneration, the other an amplifier.) As for the rest of the tubes I have, I'd be willing to sell or swap for parts I'll need.

There was a project to design a REALLY good sigle conversion ham radio and
here is the website:

http://www.warc.org.uk/cdg2000/The%20CDG2000%20Transceiver.htm

It was designed to have a fantastic dynamic range and, after seeing some
of the schematics, it has quite a few good ideas. The mixers and crystal
filters are worth studying.

One of the designers made a helical coil VCO with really good phase noise,
although the mechanical details were complex. These days, I'd want to look
into the AD9954 DDS design.

Probably still have to do something about DDS spurs, but they are fairly
low as is.

==========

So, it seems to me that there are a lot of designs for homebrew gear.
You need to look at your specific requirements to see what will suit you.

In my case, I live in a very RF HOT location, with quite a few powerful
signals. I might take the extra effort to go for maximum dynamic range.
Probably ovekill for most ham locations, but necessary for me.

Guys, this is has been an interesting discussion. I wish I was more knowledgeable - I would venture out building like that but I just don't know enough.

I'm kind of starting over. Long story...
What would be a good receiver - or good enough to listen for VFOs, test and build, etc.
Or better yet what should I avoid?
What about something like the Ten-Tec 1056 kit and some way to band switch - maybe modules...
It's kind of a catch 22 - I have to have a receiver to build one (or transmitter).

I think this link might be more helpful and cheaper.

http://dzabcik.home.texas.net/doerle.html

Of course, it doesn't have Lindsay's notes on using newer tubes.

Well, for a reasonable starting point, the KK7B line of direct conversion radios has a lot going for it. Good performance in a small package, and it can be set up for most frequencies by providing an LO nad a 90' shift for the LO in the band you want to play with.

A kit can be purchased from Kanga which has all the parts needed. They also offer the microR2 which was in the recent QST article.

http://www.kangaus.com/micror2_receiver.htm

That particular kit is set up for 40 meters, but it'd serve as an excellent starting point.

Kanga also has the slightly more general purpose miniR2 the does not ave an onboard VFO, so it is easier to use on other frequencies.

The R2 series have good dynamic ranges, and make pretty good rigs. No AGC, which takes some getting used to, but fun to use.

Oh come on, whatever your security problems, whatever your need to be a pedant, get it sorted and find some real issues to deal with.

If I was looking for something a bit unusual then a group of homebrewers is one the first places I would try. Your definition of this group is far too narrow, surely it also includes fault finding, problems and repairing. The common link is that these are things we do ourselves rather ran to the nearest shop.

I just wish I had a spare board to offer :)

Charlie.

I just tuned into this News Group to find some and not all ham's like to speak better of there self's than they act.
I thought that was why people became Ham radio Operators and had gotten away from C.B. God I hate that C.B. I get sick thinking about it. I've been a S S B Radio Operator for a long time. Yes I prefer to that think that there are Three types of Radio. No need to go there and get my but kicked by the know it's on here. It has been said so many times no matter what the Hobby. There is always someone out there trying to take the fun out of anything good. And I just seen some of them here. I have been wanting to become a Ham operator for I'll bet at least 35 or 40 years. The code has always stopped me. And the But head's and those with attitude Overly goody two shoes crowds. I have a learning disorder. It does not make me retarded, it simply means that I learn better for me in a hands on manner. Code is plainly just to much for people like me.
Now My point to all this is once again I'm hanging on a tread, I just don't know why I would want to go into Ham and put up with these too kinds people when I'm already doing it and I don't like it any better now. The only plus that I can see at this point is more Frequencies. Ham was a Hobby that was intended to be HELPFUL IN ALL OF IT'S ASPECTS.....
Now look what it's coming to. Some don't want the no Code, other's do and if they remove the code I'm afraid it will let in all the nut's .Well my friends you folks all ready have them. And in the mean time your keeping Good honest people out. Honest people aren't Born..... It takes a Very strong willingness now days to be one.. Ask me it's hard and we don't always win so . Your art form, your hobby no matter what your calling it today is steadily going by the way side. And some of you are so caught up in yourselves that you just can't see it. Some of you are the Sign of your time. I'll Bet there are a lot of old timer's just shaking in there Graves at the way you have been presenting the hobby that they helped to grow. Kind people used to run the Ham band's and there are still some out there are you one of them. Or do you just think you are Action's speak louder and farther then the Air waves. I'm not even a Hammer and I can see that..... I'll be

listening......

Well If you are familiar with the book you know he showed a version
using a 6sl7gt tube. The 12at7 triode is identical to one half of the
6sl7 (except for heater voltage) so you can use a pair of these tubes in
the same circuit.

I built the #19 version, which worked ok but this tube is VERY
microphonic. I suspect the 12at7 will not have that problem.

Another interesting version of the theme was a single tube regen that
appeared in 'poptronics. It used a 6af11 compactron. This tube has two
triodes and a power pentode, so it will drive a speaker.

Also the current issue of QST shows a very simple untuned rf amplifier
that can be added to any tube type regen receiver. It uses only 7 parts
(a resister, 3 caps, 1 diode, an rf choke, and a transistor). The rf
choke and one of the caps can be eliminated if you directly couple the
output of the rf amp to the receiver via a link added to the input coil.
One of the caps and the diode are used to steal 9v dc from the 6.3v
heater supply. I would recommend adding this as it makes the receiver

easier to tune by isolating it from the antenna.

opps I meant 12at6 tube.

5940. DDS kit

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-28 01:14:32 UTC
From: ken scharf <wa2mzeNOSPAMBOTS@bellsouth.net>
Message-ID: <sPEkh.12314$641.3726@bignews4.bellsouth.net>
Source record: 9091

I bought one of these kits to make use of a sample AD9851 chip I got from Analog Devices a few years ago.

http://www.amqrp.org/kits/dds60/index.html

I knew it was hopeless to bread board something with this chip, but even with a PC board soldering something with such close lead spacing is a challenge (especially when you're past 50 with failing close in vision and less than rock solid stable hands). Still I figured I'd give it a try. Armed with the smallest soldering tip available for my Weller PES51 soldering station, a good magnifier lamp AND a binocular microscope I gave it a try to solder the chip to the board.

Well there is good news and bad news. The bad news is that it is impossible to solder the chip by hand without creating solder bridges. The good news is that I did a good enough job to get the chip 99% perfectly centered on the solder pads, and you can remove the solder bridges with solder wick without removing the chip from the PC board.

It would have been easier with thiner solder (I had .021" dia solder) and a thiner soldering iron tip, but inspection with the microscope shows no shorts, and it looks like all the pins are properly soldered. Naked eye it doesn't look pretty but it should work.

Now to solder those chip caps and resistors! (They should be easier, the AD9851 was the worst part to place with the tight spacing, all the other parts have lead spacing at least twice as wide).

I've seen people recommend this as the preferred hand-soldering
approach for dealing with small-pitch surface mount parts. Don't
worry about creating bridges... use a bit of liquid flux on the pins,
get a nice blob of fresh solder onto the tip of the iron, and then
just gently drag the molten solder-ball along the pins and get them
soldered to the traces. Then, go back over it with solder-wick and a
bit more liquid flux, and wick away the excess.

I did smear the pc lands under the chip with paste flux first. Not a
heavy coat, just lightly applied. It does help.
I've watched the technicians at work hand solder even finer pitch chips.
One young woman has very good close in eyesight and works without a
magnifier. She does have to clean up with the solder-wick, but makes
machine like perfect solder connections. (she makes it look EASY!)
Whats hard is doing an entire board in one sitting without getting a

A good receiver is important in any ham shack.

You can build state-of-the-art performance, especially
for a single-band receiver. While some have talked
about DDS/PLL VFOs, don't underestimate the perfor-
mance of a good LC VFO built with modern components,
after a bit of tweaking to nail down the temperature
compensation.

I know you have your heart set on building something,
and there have been excellent suggestions in this
thread, but it's not a crime to buy your first receiver
to give you a known-good building block for further
development.

A single 9 MHz IF filter unit with I/Q detection (to handle the
opposite sideband) could be an other alternative and do the rest of
the filtering in audio stages.

>I would use a DDS VFO,
>but would also used a tuned (not broadband) front end. I have enough
>toroids and multi section variable caps in the junk box for that.

The _unloaded_ Q values shown by toroid manufacturers are not very
spectacular (in the 200-300 range at most). If you aim for a filter
loaded Q of 100, there are going to be a considerable loss (several
dB), so placing the filter before the first RF amplifier stage will
deteriorate the noise figure quite badly, which can be a bad thing on
upper HF bands.

With a preselector loaded Q in the 50-100 range would still cover an
entire WARC band without tuning and with wider bands and tunable front
end filters, a 100-500 kHz segment would still be present at the mixer
input at full amplitude. Thus, the mixer would still need to be strong
to handle all those signals in that range.

A preselector filter will most definitively help in keeping out strong
broadcast band signals (e.g. the strong 49 m BC band in Europe) from
the mixer, but it does not help much against strong amateur signals in
the same amateur band.

One thing you might try "next time"...

Pre-tin the PC pads by heating them with a heat gun, (being careful to not overheat the board) and applying a very small amount of solder to each pad. If you can get the IC pins all lined up with their PC board pads, tack solder one of the corner pins (or one that is easiest to solder without bridging). Use a toothpick (or some other device) to apply gentle down pressure to the IC to keep it from moving. Use the heat gun again (carefully) until the solder melts and the chip should "settle" down into the molten solder. Keep the heat gun moving around all pins to be sure all get down into molten solder. If you happen to have a piece of copper clad PC board, you can practice by putting some solder blobs on it and putting the leads of some sort of junkbox parts on to the solder and heat it up with the heat gun, apply the down pressure to the component and you can get the feel of how far the heat gun should be away from the board and the length of time it takes to melt the solder...

It's MUCH easier to begin with the easy parts! Start with the largest chip caps and resistors, continue with the rest of the simple passives, and then the largest ICs (largest pin spacing).

Finally, when you've honed your SMD skills, solder the large ICs with the small pin spacings.

And give up the industrial-strength coffee for the duration :-)

Nonsense. Homebrewing is building things from scratch, period.
Crossposters and off-topic posters like yourself are the bane of the
newsgroups. If you want to purchase parts for repair, go to
rec.radio.swap. It's why different newsgroups exist in the first
place.

I'll bet there are even more newsgroup users who are tired of people
posting messages that have nothing to do with the topic of the
newsgroup.

I'll spell it out for you: The three newsgroups you have posted to
have nothing to do with a "moment of silence". There is newsgroup
which is a catch-all for amateur radio related items:
rec.radio.amateur.misc.

Now that you know, I trust you will post correctly in the future.

Bill, W6WRT

For some reason the instructions that came with the DDS-60 kit have you solder all the ic's on first, then the resistors and caps.

After thinking I had done a good job on the AD9851 I put the board under my binocular microscope for a close in look. I saw what looked like microscopic solder bridges between the chip leads. I was able to remove these with a stiff piece of paper slid between the chip leads. I still see strange 'hair like' structures all over the board under the microscope. I may be seeing dust, bits of flux, who knows! The microscopic world is strange, especially in 3D.

Another dang canned message...it's getting kind of boring reading the
same thing over and over and over...try a new message please.

The Message Template is the enemy of actually saying something
important. It is far too easy to bring up the pre-typed message and
offer a generic response to everything that gets one's dander up.

Now to add something to make this post "legitimate"...

I'm building (from scratch) a remote frequency readout so other hams
will be able to determine which frequency I'm on while mobile, should
they actually like to talk. I plan to use only one 7447 for BCD to 7
segment conversion and each digit LED will be wired in parallel and
multiplexed. I went this way to save money, but it will have one
slightly annoying feature...no lead zero blanking. So...can anyone tell
me the proper way to hook up the blanking inputs and outputs on a 7447
(I would use one for each digit to get this lead zero blanking). The
data sheet I have isn't real clear about the BI/RBO and the RBI pin. I
suspect something like the RBO pin of a lesser significant bit would be
connected to the next higher digits RBI pin or something like that?

Oh God, be careful...you're looking to BUY something on a homebrewing newsgroup. Make sure you have zee papers when W6WRT comes jumping all over you...

Now that I've got that out of the way...are you looking for the brown square types with the color coded dots on top that look like one sided dice? I have some of those things, but I'd have to dig them out and check the values.

Old issues of Hints and Kinks and also the Radio Cyclopedia have directions
on making your own mica caps, as well as paper/foil capacitors. If you
are going to homebrew it, why not do it all the way? It would be appropriate
for the time period.

With a modern DVM, doing cut-and-try work to get the values right will be
much easier than it was eighty years ago, too.

Just plonk him. I have. He's now in my killfile just behind the script
that kills googlegroups postings -- which is where most of the OT posts
he uselessly replies to (e.g., the OP here) come from.

But, now, as additional phules start making useless replies to _his_
useless replies....

After you've done it enough under a microscope you learn what is going
to happen and you can do a lot of it without even being able to see it,
by timing and feel. Like you said in another post, there's also the
part where you get used to how disgusting any solder joint looks under
sufficient magnification...

No he is being realistic. We have more CB sets out there than ham sets
and they are no different to hams. If there is an emergency then CB ers
would probably do a better job than hams and with less quibling. I
think the writing is on the wall for ham radio since they dont provide
a thing for the country It would be better if home security took over
the frequency as we all now use the net instead. Have you heard anybody
on the radio lately if you get my drify

5964. Re: DDS kit

Newsgroup: rec.radio.amateur.homebrew
Date: 2006-12-29 07:10:10 UTC
From: Jim <kill-spam@no-spam.org>
Message-ID: <HNmdnbqlGNfOIgnYnZ2dnUVZ_ompnZ2d@comcast.com>
Source record: 8965

Personally, I'd do the DDS chip first, before the resistors and capacitors. One of the tricks I use is to clean the IC pins with rubbing Alcohol after soldering and removing shorts.

Then, I apply a hot air gun, SLOWLY bringing the temperature up on the pins of the IC. I try to get to barely melting the solder, but not burning the main board. A slow application allows the IC to heat up gradually.

This tends to remove the hairline solder bridges and clean up between the pins of the IC. Since the main DDS chip is the only part on the board, I don't have to worry about heating up and blowing the resistors and capacitors clean off the board !!!

I can, and have, used this same method on a completely assembled board, but I have to pay close attention to the small parts, the tend to want to blow away. In that case, I build a heat shield with tin foil and I press it down on the board all around the IC I want to solder flow and that usually keeps the other parts on the board where I want them.

This all takes a delicate touch, it's pretty easy to get things too hot, but it does provide nice and clean solder joints.

Hi Fred,

Unless you are interested in making precision lab-grade measurements, I think you'll do fine with much less expensive and more available cal standards. Personally, I'd get a set of adapters from your APC-7s to SMAs -- and out to only 500MHz, even BNCs should be OK. If you want to get a bit fancier, adapt the APC-7s to 3.5mm connectors, which mate with SMAs but are higher precision. I personally don't think it's worth worrying about. It's a really good idea to always leave adapters connected to the APC-7s to protect them anyway, assuming you use the instrument often enough that you don't want to leave them covered most of the time. But never leave them uncovered! They are far to easy to damage if left unmated/uncovered.

My experience designing a 3-way splitter that needed to work well to 6GHz is that inexpensive 0805 SMT resistors in the 25 to 100 ohm range work quite well to several GHz, if you're careful about the environment around them (e.g., the size and shape of the holes bored in the grounded block that holds the connectors). I expect that if you keep lead length to essentially zero, you can turn an SMB thru-hole jack into a 50 ohm load that will have at least 40dB return loss out to 500MHz: cut the center pin to the height of the resistors, and solder two 100 ohm 0.1% 0805's radially symmetrically out from the center pin to the outer shell. If possible, get someone with a known-good cal standard set to compare it with that set. An open and a short can be created in the same way. I suppose that one of the free 2-d fields solver applications could tell you if you need to make any adjustment for length, but in any event, just using the same jacks for all three should yield lengths within a degree out to 500MHz. Maybe if I get some time to play next week, I can make some measurements of hacked "standards" against my known-good ones. I'm pretty sure I still have some of the 0.1% 50 ohm parts around.

Cheers,
Tom

5966. How hard for a spy to receive 6855 or 8010 kHz?

Newsgroup: rec.radio.amateur.homebrew

Could a spy modify an AM radio by adding a few capacitors?

TIA
Clark KC7FGB

I read this:
http://www.washingtonpost.com/wp-dyn/content/article/2006/12/28/AR2006122801190.html

Messages to Spies Are Coded but Not Hidden
Over Shortwave, Anyone Can Listen

By James Gordon Meek
New York Daily News
Friday, December 29, 2006; Page A25

It turns out that anybody can tune in to the world's top spy agencies talking to operatives. All you need is a cheap shortwave-radio receiver, the kind available at any drugstore.

Tune it to 6855 or 8010 kHz.

On the hour, you might hear a girlish voice repeating strings of numbers monotonously in Spanish. "Nueve, uno, nueve, tres, cinco-cinco, cuatro, cinco, tres, dos . . .," went one seemingly harmless message heard last month on a Grundig radio.

It was the Cuban Intelligence Directorate or Russian FSB broadcasting coded instructions from Havana to spies inside the United States.

Turn the dial up to 11545 kHz, and you might hear a few notes of an obscure English folk song, "Lincolnshire Poacher," followed by a voice repeating strings of numbers. That's believed to be British Secret Intelligence Service, MI6, broadcasting from Cyprus.

On 6840 kHz, you may hear a voice reading groups of letters. That's a station nicknamed "E10," thought to be Israel's Mossad intelligence.

Chris Smolinski runs SpyNumbers.com and the "Spooks" e-mail list, where "number stations" hobbyists log hundreds of shortwave messages transmitted every month. "It's like a puzzle. They're mystery stations," explained Smolinski, who has tracked the spy broadcasts for 30 years.

While hobbyists guess at the meaning of each cryptic message or which spy service sent it, it's no mystery to intelligence officials, who confirmed the purpose is espionage.

The signals are too strong to be made by amateurs and are often on licensed frequencies. The State Department once complained to the

Israeli Embassy in Washington that "E10" was blocking a U.S. broadcast, a source said.

"I can't imagine who else would waste the time in front of a microphone reading numbers" but a spy, said James Bamford, who has written about intelligence. Bamford calls number stations "simple but effective" spycraft.

"It's extremely effective," agreed a senior intelligence official. "If you have a one-time pad, the code can't be broken, and you can send out dummy broadcasts as much as you want to confuse your enemy."

A "one-time pad" is the key to unlocking coded shortwave messages that the CIA calls "one-way voice link."

It is low-risk because it's known only to the sender and the recipient and used just once before being destroyed, said retired CIA officer Tony Mendez.

Mendez said he would often imprint the code on microfilm or even a cigarette paper. Once inside the target country, a CIA operative could make a shortwave receiver out of simple materials. "The voices are not real people," he added. "They're computer-generated."

A CIA spokeswoman declined to comment.

One-time pads and coded radio began in World War I, said Thomas Boghardt, a historian at the International Spy Museum. Little has changed since, judging by recent espionage cases involving shortwave radios, including that of a man detained in Canada last month and accused of being a Russian spy.

In Miami last week, Carlos and Elsa Alvarez pleaded guilty to lesser charges after the United States accused them of spying for Cuba. A prosecutor alleged in a court hearing this summer that they received shortwave "messages in five-digit groupings." An FBI interview transcript shows Alvarez admitted going into his bathroom "on Fridays to listen at 11" for messages aimed at the couple, code-named "David" and "Deborah."

Be sure to more or less "drown" the pins to be soldered with flux. If you get solder bridges, you probably have to little flux applied - really slob the flux on the pins. When you think you have enough of flux, add more...

Any bridges are corrected with solder wick.

The AD98xx can be soldered with a 0.5mm ceramic tip. Get one of these cheap (10$) magnifying visors, especially if you are half blind as I am...

The AD9851 is one of the easiest SMD IC's to solder as there are pins only on two sides.

Besides... We have been using SMD's since the early eighties now so stop whinging over it, adapt! They wont go away and they actually improve most RF designs!

Not well, but where can you buy an AM radio or capacitors anymore :-) ?
Or was this some hypothetical 1940's time-travel question?

A $10 super-el-cheapo pocket SW receiver from a discount store does
just fine for picking up numbers stations. Some but not all number
stations are CW or SSB and you'd need a BFO which is one step up from
the super-el-cheapos.

Tim.

Clark Magnuson <c.magnuson@comcast.net> wrote:

>Could a spy modify an AM radio by adding a few capacitors?

Possibly, but I doubt that it would work well if you started from a standard US-type AM broadcast-band receiver. The frequencies that this article speaks of are up in the HF band, roughly 10 times higher than the AM broadcast-band frequencies, and these radios' built-in loopstick antennas are not well suited to receive these sorts of signals.

A spy in most Western countries could simply buy an off-the-shelf AM/FM/shortwave receiver (very widely available).

Simple but very effective direct-conversion or superheterodyne receivers (capable of receiving CW, SSB, and AM) can be built out of "junk box" parts by anyone with a modest amount of training and experience. Many of the popular QRP receiver designs could be tweaked to receive on these sorts of frequencies with very little difficulty.

Now, if somebody had an old "7-transistor" AM radio (circa 1960 or so), it would likely be possible to salvage enough parts from it to build a simple direct-conversion shortwave receiver.

I doubt that this would be possible (or at least not easy) for today's highly-integrated IC-based radios.

I've seen some suggestions go around that are very similar to hot-air
rework. I just wanted to mention that SparkFun electronics sells some
rework stations cheaply, and has useful tutorials on soldering SMD
parts. Their site: http://www.sparkfun.com

Could you clarify this? You mean there are Web sites where
you type in an arbitrary frequency and hear what's being
broadcast on it?

When you have a proper pc board smt is easy (once you've mastered the
new soldering techniques. I had no problem getting the AD9851 onto the
board. I think the microscopic hairs I'm seeing are a result of using
the solder braid wick. I may have not heated it enough and pulled it
off too soon leaving solder hairs behind. Flux sure does help, and I'll
use plenty when I solder the next few smt ic's down.

I have some smt mounting boards that allow mixing smt parts with through
hole on 100 mil grid proto boards. I fear that the extra long leads
this adds to the smt parts will make rf performance a problem,
especially with 100-400mhz clock signals to the dds chips (AD9951).
I've heard of people designing their own pc boards using laser printer
output and iron on toner for resit. I've tried this before but with
'bleeding' of the toner during application I don't think I can get
better than 50 mil trace separation. Also I've had bad luck etching
boards with very thin traces, the traces get etched away before larger
areas of copper are finished etching. If I try designing boards for SMT
parts I'll probably have to farm them out to a professional house, but
this can be expensive for making but one board. (Unless you plan on
writing a QST article and selling the extra boards....).

Well, some numbers stations actually transmit modulated morse, so you
wouldn't need a BFO.

Print your design on some kind of clay coated paper (people have
used everything from magazine pages to photo paper intended for
inkjets) and look at the print with a loupe. Cheap laser printers
will produce a result full of pinholes. A nice Xerox will make a
good, solid black. I haven't had any trouble with toner melting
or running. In fact, once you transfer it onto the PCB it's hard
to get off!

You've got to pick the right board house for each order. Some, like
batchpcb.com, are particularly cheap if you want few, small boards.
They don't have setup fees or even per-board fees, only a per-order
charge. But their $2.50/in^2 grows faster than some other places
which have bigger minimum size boards/minimum orders.

I have been using an off-shore fab for years and they seem to do just what i
want, but have setup fees that make protos expensive. So I went and looked at
batchpcb.com but they do mention a $US10 setup fee in their FAQ.

http://www.batchpcb.com/faq.php?osCsid=87afcc3754a0ea1bc1a389ad75decda8

Do they actually charge it?

My problem with the iron on transfers wasn't being able to print thin,
close spaced lines on to the transfer medium. The problem was that when
ironed on the toner lines 'spread out' so adjacent lines touched. Also
a problem was timing just how long to leave the board in the soup to
etch. I did heat the etchant up first and used an IR lamp to try and
keep it warm, but even so the thin close spaced traces were close to
being over etched long before larger and wider spaced traces were
'done'. (maybe a problem with 'Radio Shack' etchant?)

Yeah, but I'll bet your first year students' eyesight is 30 years
younger than that of the average participant in this NG<grin>!

There's a $10 fee per order. But it's not per board or even per design.
It's more like a "shipping and handling" fee. So if you keep some boards
on file with them you can always throw in a few (smt adapters, or proto
boards) with another order for only the sq in cost.
